

CIRCUIT COURT OF THE FIFTEENTH JUDICIAL CIRCUIT
IN AND FOR PALM BEACH COUNTY, FLORIDA
CASE NO.: CL 95-1466-AH

----- x
THE STATE OF FLORIDA, et al.

Plaintiffs,

vs.

THE AMERICAN TOBACCO COMPANY,
et al.,

Defendants.
----- x

Property of: Ness, Motley
Main PI File Room
Charleston, SC

DEPOSITION OF: JOHN C. RUCKDESCHEL, M.D.

DATE: March 23, 1997

TIME: 10:02 a.m. to 12:13 a.m.
1:16 p.m. to 5:42 p.m.

PLACE: Wilkes Reporting Service, Inc.
101 East Kennedy Boulevard
Barnett Plaza, Suite 1460
Tampa, Florida 33602

REPORTED BY: Jean M. Wilkes, RPR-CP
Notary Public
State of Florida at Large

3	Expert Disclosure for John C. Ruckdeschel, M.D. 294

1 The videotaped deposition, upon oral
2 examination, of JOHN C. RUCKDESCHEL, M.D., F.A.C.P.,
3 taken on the 23rd day of March, 1997, at the offices
4 of Wilkes Reporting Service, Inc., 101 East Kennedy
5 Boulevard, Barnett Plaza, Suite 1460, Tampa,
6 Florida, beginning at 10:02 a.m., before Jean M.
7 Wilkes, RPR-CP, Notary Public in and for the State
8 of Florida at Large.

9 - - - - -

10 THE VIDEOGRAPHER: This is the videotaped
11 deposition of Mr. John C. Ruckdeschel, M.D.,
12 taken by defendants in the matter of State of
13 Florida, et al. versus American Tobacco
14 Company, et al., Case Number CL-95-1466 AH.

15 MR. SCHLESINGER: I'll tell you. Would
16 you be kind enough to start that all over
17 again?

18 THE VIDEOGRAPHER: Sure.

19 MR. SCHLESINGER: It's Dr. Ruckdeschel.

20 THE VIDEOGRAPHER: Certainly.

21 (Discussion off the record.)

22 THE VIDEOGRAPHER: This is
23 the videotaped deposition of Dr. John C.
24 Ruckdeschel, M.D., taken by the defendants in
25 the matter of State of Florida, et al. versus

1 American Tobacco Company, et al., Case Number
2 CL-95-1466-AH, being held in the offices of
3 Wilkes Reporting Service, located at 101 East
4 Kennedy Boulevard, Suite 1460, Tampa, Florida.
5 Today is March 23rd, 1997. The time is
6 10:02 a.m.

7 My name is Silvia Borges. I'm with the
8 firm of Sunray Legal Videos located in Tampa,
9 Florida, and I'm the videotape specialist.

10 The court reporter is Jean Wilkes with
11 Wilkes Reporting.

12 Counsel will now introduce themselves.

13 MS. ECKELS: Lynne Eckels with the firm
14 of Shook, Hardy & Bacon. Accompanying me is
15 Chris Wilson, analyst for Shook, Hardy & Bacon.

16 MR. SCHLESINGER: My name is Sheldon J.
17 Schlesinger for the State.

18 THE VIDEOGRAPHER: And the court reporter
19 will now swear the witness.

20 THE COURT REPORTER: Would you raise your
21 right hand, sir?

22 JOHN C. RUCKDESCHEL, M.D., F.A.C.P.,
23 being first duly sworn to testify the truth, the
24 whole truth, and nothing but the truth, was examined
25 and testified as follows:

EXAMINATION

BY MS. ECKELS:

Q. Dr. Ruckdeschel, we introduced ourselves just a few moments ago, but would you again kindly state your full name for the record, sir?

A. John C. Ruckdeschel.

Q. Dr. Ruckdeschel, I'm aware you may have given depositions previously, but I'd like to reach a few agreements with you --

A. Surely.

Q. -- that I think will allow the deposition to run smoothly.

The first is, it is important that you give me a complete verbal response. Sometimes it's easy, in a course of a deposition, for things to become conversational and for you to shake your head and say "uh-huh" or "unh-unh." But if you will give a verbal response, I would appreciate it. Will you do that, sir?

A. Certainly.

Q. It's also important, so that we get a clear record, that you and I not speak at the same time. I will endeavor to always allow you to completely finish your answer before I begin another question. If you will extend me the same courtesy,

1 I think that will help our court reporter. Will you
2 do that as well?

3 A. I'll be happy to.

4 Q. Dr. Ruckdeschel, if at any time I pose a
5 question to you that seems vague to you or you are
6 uncertain what I am asking, please tell me and allow
7 me an opportunity to rephrase the question. Will
8 you do that as well?

9 A. I will do that.

10 Q. And, finally, Dr. Ruckdeschel, if at any
11 point in time you wish to take a break, stretch your
12 legs, confer with counsel, et cetera, just let me
13 know and I'll be happy to accommodate you. Okay?

14 A. Thank you.

15 Q. Dr. Ruckdeschel, I'd like to start off
16 the deposition by covering some of your background
17 information. Can you tell me, what is your current
18 employment?

19 A. Yes. I am the Director and Chief
20 Executive Officer of the H. Lee Moffitt Cancer
21 Center & Research Institute at the University of
22 South Florida here in Tampa, Florida.

23 Q. Do you have a business address there,
24 Doctor?

25 A. Yes. It's 12902 Magnolia Drive, Tampa,

1 33612.

2 Q. How long have you been here in the Tampa
3 area, Doctor?

4 A. About 5 1/2 years.

5 Q. During the course of that 5 1/2-year
6 period, have you always held the same position that
7 you just described to me with Moffitt?

8 A. Yes, ma'am.

9 Q. And is it all right with you if, during
10 the course of the deposition, I refer to the
11 facility as "Moffitt" --

12 A. Yes, ma'am.

13 Q. -- rather than the full --

14 A. Yes.

15 Q. -- full name? Thank you.

16 How old a person are you,
17 Dr. Ruckdeschel?

18 A. 51.

19 Q. Let me briefly just reiterate, as I'm
20 sure you've heard before, this deposition is just
21 like testifying at the courthouse in front of a
22 judge and the jury. To the extent that I'm going to
23 ask you as clear questions as I can, I need you to
24 give me as honest and as truthful response as you
25 possibly can. Will you do that?

1 A. Yes, ma'am.

2 Q. Let's briefly cover your educational
3 background, if we may, starting with, where did you
4 graduate from high school?

5 A. Oceanside High School.

6 Q. And where is that located?

7 A. In Oceanside, New York.

8 Q. And what year was that, sir?

9 A. 1963.

10 Q. Did you go directly into an undergraduate
11 program from graduation?

12 A. Yes, I did. I went to Rensselaer
13 Polytechnic Institute.

14 Q. I'm sorry. I didn't hear. The name,
15 again?

16 A. Rensselaer, R-e-n-s-s-e-l-a-e-r,
17 Polytechnic Institute in Troy, New York. It is a
18 science and engineering school, very similar to MIT.

19 Q. Thank you. And was that a full four-year
20 undergraduate program?

21 A. Full four-year undergraduate. That's
22 correct.

23 Q. And what degree or degrees did you attain
24 upon completion?

25 A. Bachelor of Science in Biology.

1 Q. Okay. In approximately what year was
2 that, sir?

3 A. 1967.

4 Q. Okay. And upon completion of that
5 program, what did you do next?

6 A. Went to medical school at Albany Medical
7 College in Albany, New York.

8 Q. And did you complete that educational
9 program?

10 A. Yes, I did, in 1971.

11 Q. And what did you do immediately following
12 completion of that program?

13 A. I began an internship at Johns Hopkins
14 Hospital in Baltimore, Maryland.

15 Q. And how long did that internship last?

16 A. One year.

17 Q. And was there a particular field of
18 specialty or a particular field of medicine that you
19 concentrated in during that one-year internship?

20 A. Internal medicine. It was what was
21 called then a straight medical intern.

22 Q. What did you do upon completion of that
23 one year at Johns Hopkins?

24 A. I was offered a position in the
25 United States Public Health Service at the National

1 Cancer Institute. They had a facility in Baltimore
2 at their -- at the U.S. Public Health Service
3 Hospital called the Baltimore Cancer Research
4 Center, and I was offered a position there, which
5 I accepted.

6 Q. And what was that position?

7 A. It was, at first, a staff associate, is
8 what they called -- essentially, a fellowship period
9 of time.

10 Q. And how -- what was the duration of that
11 fellowship?

12 A. Three years.

13 Q. And, again, during the course of that
14 three-year fellowship, was there a particular area
15 of medicine that you concentrated in?

16 A. Two areas. One was -- I'm sorry --
17 several areas. One was, of course, medical
18 oncology, which is what I was training in.

19 Secondly, was internal medicine, as
20 a whole, because the hospital itself did not have
21 a full range of specialists; and, therefore, we
22 served, essentially, as our own consultants within
23 that area of the other areas of internal medicine.

24 And, in addition, cancer research,
25 particularly in the area of cancer immunology.

1 Q. And did you complete that three-year
2 fellowship?

3 A. Yes, I did, in 1975.

4 Q. What did you next do professionally after
5 completing that fellowship in '75?

6 A. Yes. At that time the NIH positions
7 were offered to individuals at the end of either
8 their first year of training, their internship, or
9 their second year of training. Mine was offered
10 at the end of my first year of training; and,
11 therefore, in order to complete my certification
12 in internal medicine and then be able to sit for my
13 boards in medical oncology, I had to go back and do
14 a year of residency training in general internal
15 medicine, and I did that in 1975 to 1976 at the
16 Harvard Hospital, Beth Israel Hospital in Boston,
17 Massachusetts.

18 Q. Okay. So that was an additional year
19 of residency. Correct?

20 A. That's correct.

21 Q. Okay. What did you do professionally
22 following the completion of that additional year of
23 residency at Beth Israel?

24 A. I moved to the Albany Medical College
25 where I assumed the position of Assistant Professor

1 of Medicine in the Division of Medical Oncology.

2 Q. At that point, were you licensed to
3 practice medicine in the State of New York?

4 A. Yes, New York and Massachusetts.

5 Q. Is your licensure in New York still
6 active, Doctor?

7 A. Yes, it is.

8 Q. Is your licensure in Massachusetts still
9 active?

10 A. No, it is not.

11 Q. What other states are you currently
12 licensed to practice medicine in?

13 A. The state of Maryland, which is inactive,
14 and the state of Florida, which is -- which is
15 active.

16 Q. Have you ever applied for licensure in
17 any other states?

18 A. I don't believe so, no.

19 Q. Okay. Are you currently -- I think this
20 is a common term -- board certified in any
21 particular areas of specialty?

22 A. Yes, in two.

23 Q. And what would those be, Doctor?

24 A. I'm board certified in internal medicine
25 and in medical oncology.

1 Q. For the benefit of those that may someday
2 hear or read this deposition, would you define for
3 me, in basic laymen's terms, what is medical
4 oncology?

5 A. Yes. Medical oncology is the application
6 of internal medicine to the care of the cancer
7 patient. It originally grew up in -- or around the
8 therapeutic modality which is chemotherapy. But
9 what has happened over the last 20 years is that the
10 medical oncologist has become the primary care
11 specialist, if you will, for the cancer patient, the
12 person who helps them through both their treatment,
13 their diagnostic phase, and their terminal phase of
14 their illness, and manages all of the other things
15 that happen to them while they also happen to have a
16 malignancy.

17 Many people rely on their medical
18 oncologist, basically, as their primary care
19 physician during the period of time when their
20 cancer is active, and so that -- that's
21 fundamentally what the field is.

22 Q. And could you also define for me,
23 Doctor, the field of internal medicine? You used
24 that phrase as a part of that definition, but it's
25 also a separate certification you hold.

1 A. Yes. Internal medicine is what I think
2 are -- originally was described as diagnostics.
3 It's the person who takes information from any
4 number of thousands of sources and -- bits of
5 information and puts that together into a diagnosis
6 for a patient.

7 It also has assumed, over the last
8 50 years, the sum of its various subspecialties,
9 gastroenterology, kidney disease, endocrinology,
10 hormonal illnesses, such as thyroid, that whole
11 array of things. And so your training is across
12 the board in all of those nonsurgical aspects.

13 You learn to do -- you train in surgery
14 as well. You learn pre and postoperative care, but
15 you don't actually practice surgery, per se, so
16 it is all those other areas of medicine.

17 Q. I believe you stated a moment ago
18 that, upon completion of your various fellowships,
19 internships, residency programs, that you went back
20 to Albany Medical College and took a position there.
21 Is that correct?

22 A. That's correct.

23 Q. What was your initial position, if you
24 could describe it for me, when you went back to
25 Albany Medical School?

1 A. Yes. I was a junior faculty member and
2 Assistant Professor of Medicine in what was then
3 called the Division of Oncology.

4 Q. Okay. And what does that mean? What
5 type of duties did that entail?

6 A. That entailed, at that time, basic
7 research. I continued to do immunology research.
8 It entailed clinical research and cancer clinical
9 trials. It involved the care of patients with
10 cancer and it involved teaching medical students,
11 residents and fellows.

12 Q. Could you give us, Doctor, a general
13 understanding and definition, to differentiate
14 between immunological research and clinical
15 research? You just used both of those terms.

16 A. Yes. When I speak to immunologic
17 research, I'm speaking to what we call "bench"
18 research. That's actual laboratory research where
19 one is looking at studying fundamental biologic
20 processes, and I've been involved in that at several
21 different levels over the years.

22 Clinical research is where you actually
23 translate all of those test tube findings and animal
24 findings into patient research, and it's -- whatever
25 treatment we think is better or wonderful or

1 magnificent has to be compared, at some point in
2 time, formally or informally, to the treatments we
3 have available. The formal process of doing that is
4 called clinical research, and that's been an area of
5 expertise for 25 years.

6 Q. Were you involved in bench or lab
7 research during the entire time you were at Albany
8 Medical College?

9 A. Up until about the last year, yes.

10 Q. As a part of your lab research, were you
11 involved in any particular animal studies?

12 A. As a medical student, I was involved
13 in animal studies. As a faculty member, all of my
14 studies were involved with human tissues but not
15 animals.

16 Q. We can cover this in more detail later,
17 but let me ask the same question in slightly broader
18 terms. Since leaving Albany Medical College, to
19 date, have you been involved in any laboratory
20 research involving any particular animal studies?

21 A. No, I have not. Not directly.

22 Q. During your tenure at Albany Medical
23 College -- and I'm talking about professionally, not
24 as a student -- did you continue to progress and
25 take on other responsibilities and obtain other

1 titles while you were there?

2 A. Yes, I did.

3 Q. What was that progression?

4 A. I became, in 1979, an Associate
5 Professor of Medicine. In 1983, I believe, I went
6 on sabbatical to the National Cancer Institute for
7 a year.

8 I then returned. I was made Professor
9 of Medicine and then was made head of the Division
10 of Medical Oncology -- Division of Oncology.

11 We petitioned to have the name changed
12 to Medical Oncology to distinguish it from surgical
13 and radiation, and that was done.

14 At that time, I had developed an interest
15 in behavioral sciences and had been doing research
16 in that area, and so we added a section onto the
17 division.

18 I was then asked to be the division head
19 in medical oncology. At that time, the infectious
20 disease specialists all left the institution as we
21 were struck by the AIDS epidemic. We were just
22 north of New York with 17 prisons in our catchment
23 area, and we were almost overrun by it. And so the
24 oncologists, myself in particular, had to pick up
25 the early wave of the AIDS epidemic, and so that

1 came under our jurisdiction as well. So I ran the
2 AIDS unit and the Division of Medical Oncology.

3 After about three or four years, we
4 recruited someone else to head the AIDS unit and --

5 And then, during my -- about three or
6 four years before I left, they began the process of
7 -- one of several attempts to initiate a cancer
8 center at Albany, and I was named Director of the
9 Joint Center for Cancer and Blood Disorders in '88
10 or '89. I can't remember the exact year.

11 It was actually a fluid period of time,
12 so I can't remember exactly which date. I'm sure I
13 can refer to it and --

14 Q. I understand. I'm not trying to pinpoint
15 you to months and dates. I'm just trying to get a
16 general --

17 A. Yeah.

18 Q. -- feel for the history.

19 You mentioned, just a moment ago, Doctor,
20 that at one point you took a one-year sabbatical to
21 participate with the NCI.

22 A. That's correct.

23 Q. And, again, for clarification -- and
24 I may ask you this throughout the deposition --

25 A. No problem.

1 Q. -- every time we use initials, to make
2 sure we understand what we're talking about --
3 you're referring to the National Cancer Institute?

4 A. That's correct.

5 Q. What was the purpose of that one year at
6 NCI? Was it a particular program, or was there an
7 emphasis for that one year?

8 A. Yes. The -- in the period in question, I
9 was an Associate Professor and was not particularly
10 enthused about the administrative direction that the
11 college was taken -- taking, and so I elected to
12 return to basic science -- keep seeing patients, but
13 to return more to basic science and not involved as
14 much in the administrative duties.

15 And so I took the year of sabbatical.
16 I took it with Dr. John Minna, M-i-n-n-a, and
17 Dr. Adi Gazdar, A-d-i, G-a-z-d-a-r, both of whom --
18 Dr. Minna, in particular, headed the National Cancer
19 Institute's lung cancer operations, and they were
20 stationed at the National Naval Medical Center,
21 commonly known as Bethesda Naval, directly across
22 the street from the main NCI campus.

23 I spent a year in cell biology with
24 them, working with -- and helping develop human
25 lung cancer cell lines and doing some -- part of

1 the original group through the early and mid
2 1980s, defining the biology of lung cancer and the
3 multiple genetic changes that occurred in that
4 disease. And went back to Albany and attempted
5 to -- and re-established a laboratory in that area;
6 and then about two years later was raised to
7 division head and center director there, so I
8 eventually gave that up, just before I came down
9 here.

10 Q. You mentioned previously, Doctor, that
11 once you returned to Albany, after spending a year
12 at NCI, that you had developed an interest in
13 behavioral sciences.

14 A. Yes.

15 Q. Would you define or explain what
16 behavioral sciences are?

17 A. Yes. In -- they're a very broad field.
18 But in the context of what I have done, we had
19 initially looked at issues in our -- a cancer course
20 that we had taught and had been funded by the
21 National Cancer Institute to develop, and we had
22 looked at attitudes of students before and after the
23 course and found that a very unsatisfactory measure.

24 We decided that attitudes were of no
25 importance. It was actual behaviors that were of

1 importance. And so we began a 10-year study of
2 physician behavior with patients. It had never been
3 described before. These were almost field studies
4 in the Margaret Meade tradition of being out in the
5 field. No one had ever described what a physician
6 does on his rounds, what they said to patients,
7 whether they touched them, whether they sat, stood,
8 went in the room, how long they spent. And so we
9 defined that.

10 Then we looked at a whole series of
11 studies on what impacted on those behaviors and how
12 that impacted on physician satisfaction, and those
13 studies continue in varying formats till today.

14 Q. When you returned to Albany after
15 spending the year at NCI, and then became head of
16 the Medical Oncology Division -- am I saying that
17 correctly? --

18 A. Yes. That's correct.

19 Q. -- could you give me an estimate of how
20 your time was divided between a clinical practice,
21 i.e. seeing patients, versus administrative time,
22 versus research laboratory time?

23 A. Yes. Unfortunately, only about
24 10 percent of my time was basic research time.
25 Another 15 percent or so was clinical research time.

1 Administrative time took about another
2 15 percent; clinical care, about 50 percent. And
3 then I had -- about 10 percent of my duties were in
4 national administrative duties. I was chairman at
5 that time of the Lung Committee, now the Thoracic
6 Committee, the Eastern Cooperative Oncology Group,
7 and I was also the Executive Officer of the Lung
8 Cancer Study Group. Those are both National Cancer
9 Institute-supported multi-institutional, what we
10 call "cooperative groups" for performing clinical
11 research.

12 Q. And during that time period, Doctor,
13 did you also act as a consulting oncologist to other
14 medical facilities?

15 A. Yes.

16 Q. And those would include -- and correct
17 me if I'm leaving anything out -- a St. Mary's
18 Hospital, Samaritan Hospital, a St. Peter's
19 Adirondack -- I'm sorry --

20 A. Adirondack Medical Center.

21 Q. -- Adirondack -- thank you -- Medical
22 Center, and the Community Health Plan in Lakeland?

23 A. Yes. That's correct.

24 Q. Am I leaving anything out, Doctor?

25 A. Yes, ma'am, the Veterans Administration

1 Medical Center in Albany.

2 Q. Thank you. And what percentage of your
3 time would you estimate was devoted to being a
4 consulting oncologist for those various facilities?

5 A. I've included that in my clinical time.
6 The -- each of them sort of came in turn. The time
7 at the VA would be one or two months a year, at
8 most, where I would take a turn on rotation or
9 teaching there or on the clinical service there.
10 The Samaritan and St. Peter's were only for those
11 occasional instances when our patients were admitted
12 there.

13 The St. Mary's, we originally set up
14 a Community Cancer Center there in the late 1970s
15 or early 1980s. And then the General Hospital
16 of Saranac Lake, which became Adirondack Medical
17 Center, we established a cancer program there, and
18 I would fly there approximately once a month. And
19 each of us would, in turn, once a week go up there
20 -- so myself, once a month -- to see patients in
21 that facility.

22 Q. So the time which you devoted to those
23 facilities as a consultant was included in the
24 50 percent clinical care --

25 A. That's correct.

1 Q. -- estimate that you gave me earlier?

2 A. That's correct.

3 Q. You've given me, I think, a good
4 description, Doctor, of your various duties at
5 Albany. How did those duties vary when you became
6 the Director for the Joint Center of Cancer and
7 Blood Disorders, if they changed at all?

8 A. Yes. The administrative time went
9 up. The -- actually, I'm not sure the percentages
10 changed in particular. The weeks just got longer.

11 Q. I understand. Did you have to eliminate
12 any of the other categories from your schedule, that
13 being research or clinical research?

14 A. Yes. That's when I began to reduce my
15 basic research activity and to recognize that I was
16 not going to be able to successfully pursue the
17 basic science activities because I could not devote
18 sufficient time to it.

19 Q. And so I make sure I understand
20 you correctly, when you say "reduce your basic
21 research," you're referring to the bench or the
22 laboratory research?

23 A. Laboratory. That's correct.

24 Q. And was that the position you ran, as
25 Director of the Joint Center for Cancer and Blood

1 Disorders, when you left Albany?

2 A. That's correct.

3 Q. Okay. And when did you leave Albany?

4 A. I left Albany in November or December
5 of 1991.

6 Q. And why did you decide to leave Albany at
7 that point in time, Doctor?

8 A. I was made a relatively spectacular job
9 offer here in Tampa.

10 Q. Okay. And that's the position with
11 Moffitt which you've already described for me?

12 A. That's correct.

13 Q. Since arriving in Tampa in -- I'm sorry
14 -- '91?

15 A. I arrived here in December of '91 and
16 formally started my position on January 1st, 1992.

17 Q. Okay. Since arriving at Moffitt in
18 January of '92, has your position remained the same
19 the entire time?

20 A. Yes, it has.

21 Q. Can you generally describe your duties
22 and responsibilities for me at Moffitt?

23 A. Yes. I sustain about 10 to 15 percent
24 time in clinical practice, limited almost
25 exclusively to the field of lung cancer. I spend

1 about five percent of my time still involved in
2 clinical and behavioral research, and the remainder
3 of my time is administrative, running a cancer
4 center -- a research institute and all the various
5 facilities and et cetera that we have there.

6 Q. That would make approximately 80 percent
7 dedicated -- 80 percent of your time dedicated to
8 administrative functions. Correct? Would that --

9 A. Is that what that added up to?

10 Q. That's what it added up to on my math.
11 Does that sound about right to you?

12 A. Yes.

13 Q. Are you teaching, Doctor?

14 A. Incidental to my clinical activities,
15 yes. I see -- when I round, I will have either
16 students or fellows or residents there as part of
17 that. I, of course, teach in hundreds of graduate
18 medical education programs.

19 Q. Help me understand, if you will, Doctor.
20 When you say that you're spending about 10 to 15
21 percent of your time in a clinical practice, does
22 that mean you're spending 10 to 15 percent of your
23 time seeing individual patients, or is that
24 observing groups of patients for studies? Could you
25 give me some ideas there?

1 A. It's all -- it's seeing individual
2 patients. I'm the only person in the southeast
3 listed in Good Housekeeping and Best Doctors in
4 America for Lung Cancer, and so I have two and three
5 calls a day for referrals for lung cancer patients.

6 I cannot see them all, but we have a
7 group that we call our Thoracic Oncology Program
8 with four other medical oncologists, who do --
9 just do lung. The radiation therapists and
10 pulmonologists who -- and we work as a group with
11 our two -- now, three thoracic surgeons. And so one
12 of the other members will see it, but they all --
13 most of them funnel through my office. So it's --
14 it's probably 30 hours a week, but it's -- it's
15 still only 20 -- 15 percent, or whatever it is, of
16 my time.

17 Q. And in this thoracic oncology group,
18 there are oncologists plus what other professions?

19 A. There's -- 1, 2, 3, 4 -- five medical
20 oncologists, two pulmonologists, three thoracic
21 surgeons and one radiation oncologist, all of whom
22 devote virtually all of their professional time to
23 lung cancer.

24 Q. Would it be fair to say that this group,
25 the thoracic oncology group that you've just

1 described, sees very little, if any, cancer
2 patients, other than those presenting themselves
3 with lung cancer?

4 A. Yes, we -- since we call it a thoracic
5 group, we also see mesotheliomas, thymic, anything
6 involving the chest, including metastatic disease
7 to the chest where there's an -- where there's a
8 diagnostic dilemma posed for individuals. And
9 we see -- I see occasional other VIP patients.
10 If the Governor's office calls and has someone, or
11 whatever, I will generally make room on my schedule
12 to see them. Or if Mr. Moffitt calls and says a
13 friend has a certain kind of cancer, I will usually
14 find a spot in my schedule, whatever that problem
15 is.

16 Q. I understand. Within this thoracic
17 oncology group, can you give me an idea of how many
18 patients you actually see in the course of, let's
19 say, a given month or a week, whatever is easiest
20 for you?

21 A. Yes. Sure. I see anywhere from two to
22 five new patients each week. That program sees
23 approximately 500 new lung cancer patients. The
24 others are fairly small numbers, but about 450 to
25 500 new patients each year.

1 I personally see about 70 or 80 new
2 patients within that, and so my -- when I'm in town,
3 I'll see up to four or five patients a week. There
4 are periods when I'm out during the year at various
5 meetings. But what we do is we have a physical area
6 set aside, the thoracic oncology area. It operates
7 as a practice composed of all the individuals I've
8 told you that uses that space all during the week.

9 On Wednesdays we have our consultation
10 day, our multi-disciplinary clinic day, and we will
11 see anywhere between 13 and 15 new patients on that
12 day. They will be seen by one of us in the group.

13 We break at about 1:00 for an hour and
14 a half, discuss all the cases that were seen. And
15 then anybody who needs to see another specialist as
16 well, where we're going to have combined therapy,
17 they will see that individual in the afternoon, and
18 they may get CAT scans or biopsies or something
19 during the course of the day, but we basically try
20 to do all of the consultation in one day.

21 Q. Everyone in this thoracic oncology group
22 is a full-time staff member of Moffitt?

23 A. Yes. Well, they're all faculty members
24 at the University of South Florida. Each of them
25 has varying amounts of other duties: some, basic

1 research; some operate at the VA or at the Tampa
2 General Hospital as well, but their primary,
3 overwhelming clinical responsibilities are through
4 the Thoracic Oncology Program.

5 Q. How do most, if not all, of the patients
6 that are seen by you and this group -- how do they
7 reach you? How do they become introduced or get an
8 appointment to see one of the members of this group?

9 A. Multiple sources. I would say a little
10 over half of them -- probably 50 to 60 percent of
11 them -- are referred by other physicians, either
12 within the region, within the state, or within the
13 -- within the country. Occasionally outside the
14 country; Canada and South America in particular.
15 The physicians will call, usually directly to one
16 of us, and make arrangements in that direction.

17 There are a whole series of patients who
18 will, through various means, learn of our program.
19 As I said, we're listed heavily in Best Doctors in
20 America, Good Housekeeping, et cetera, and they
21 will -- they will have those lists somewhere. And
22 increasingly, there's a group who come in off the
23 Internet who've learned about us from there. And
24 so they will call directly. They might call
25 through our Cancer Answers line; and when the staff

1 recognizes they have lung cancer, they'll be sent to
2 the program. Or they can call the place directly
3 and say, "I want" -- "I have lung cancer; I want to
4 be seen," and they'll get an appointment as well.
5 We'll -- we'll see anyone.

6 Q. Okay. Is -- and I think you may have
7 just anticipated my next question. Is there a
8 particular criteria that this Thoracic Oncology
9 Group at Moffitt has for determining who they will
10 or will not see other than simply an individual
11 presenting themselves with a diagnosis of lung
12 cancer?

13 A. I think the only thing that would keep a
14 patient -- keep us from seeing a patient is if their
15 insurance company won't let them come there.

16 We'll see them anyway, but they need --
17 they get cautioned, then, that they do so at their
18 own financial peril in these times. But that's the
19 only reason we wouldn't see a patient.

20 Q. Do you know, Doctor, what percentage,
21 if any, of the patients currently under the care
22 of this Thoracic Oncology Group are Medicaid
23 recipients?

24 A. I would estimate between 8 and
25 12 percent.

1 Q. And, for clarification, how do you
2 determine -- or how do you know which ones are
3 Medicaid patients and which ones are not?

4 A. We normally pay very little attention
5 to that. It's listed on the forms. Hospital
6 clinics have to collect certain data, and it's
7 called a UB -- capital U, capital B -- 82 Form, and
8 it's -- you're required to collect certain amounts
9 of information. Who the primary insurer is is
10 listed there. And the only time it becomes of
11 importance is when we need a particular service,
12 and it may or may not be available to a Medicaid
13 patient; and, therefore, we have to work with our
14 social work team to try to provide that service in
15 some other way.

16 Q. What types of services would not --
17 that you may want to recommend or that anyone in
18 your oncology group may want to recommend -- would
19 not be available to a Medicaid recipient?

20 A. Occasionally, some forms of counseling
21 or home care. I mean, they're fairly small.

22 Actually, the Medicaid program takes
23 pretty good care of the patient. It doesn't pay us
24 very well, but it does -- the patients do get good
25 care. Most things are available to them. There's

1 just, like, transportation that need to be sorted
2 out and -- excuse me. I'm sorry. Go ahead. Those
3 are the issues.

4 Q. Okay. And I take it from your prior
5 comment, there is a difference between what Medicaid
6 will reimburse you, as a physician, to care for
7 Medicaid patients versus what some private insurance
8 companies will reimburse for that -- offering that
9 same care?

10 A. Yes.

11 Q. How would you describe the difference
12 between the two?

13 A. Well, it used to be an enormous
14 difference. It is much less so in this era of
15 managed care.

16 Fundamentally, Medicaid has placed
17 restrictions on the dollar costs of outpatient care
18 and on the number of days of hospitalization
19 permitted. They actually reimburse us extra as a
20 teaching hospital for the inpatient care, and we are
21 in negotiations with the state program to break
22 through some of the recommendations, some of the
23 reimbursement issues on the outpatient side, as
24 cancer is a little bit different than the
25 traditional outpatient problems that patients face.

1 Q. Is there any policy, within this Thoracic
2 Oncology Group at Moffitt, as to a quota or a limit
3 as to how many Medicaid patients they would accept?

4 A. No. No, nowhere in the institution.
5 We are -- we were founded by the state. We're a
6 not-for-profit corporation, but we would not limit
7 patients in any way.

8 Q. We discussed earlier when you were
9 at Albany various facilities which you served as a
10 consulting oncologist. Are there similar -- are you
11 in a similar situation in Florida, meaning are there
12 other facilities to which you're consulting to now?

13 A. Yes. I have consulting privileges at
14 Tampa General Hospital and at the James Haley
15 Veterans Administration Hospital across the street
16 from the Cancer Center -- or across the street from
17 the medical school. I don't -- I don't believe I've
18 used either of them, given the nature of my duties,
19 but they are available to me.

20 Q. You mentioned earlier that your teaching
21 experience right now is fairly incident to your --

22 A. Clinical work.

23 Q. -- clinical work. Could I take that to
24 mean that you're not actually doing classroom
25 teaching at this point, or are you?

1 A. I would -- I usually do one or two
2 classroom lectures a year, but very -- very minimal.

3 Q. I'm sure there are numerous professional
4 associations for which you are a member. But if you
5 could list for me, Doctor, those which you consider
6 the ones that you are most active in.

7 A. The American Society of Clinical
8 Oncology, the American Association for Cancer
9 Research, the American College of Physicians,
10 the American College of Chest Physicians, the
11 Florida Society of Clinical Oncology, the Eastern
12 Cooperative Oncology Group, the American Cancer
13 Society.

14 I'm just trying to think if there
15 are any -- oh, and the American College of Chest
16 Physicians.

17 Q. Do you hold any particular offices or
18 noteworthy positions with any of those
19 organizations, Doctor?

20 A. Yes, in the -- I'm on the board of --
21 the local board of the American Cancer Society,
22 the county board. I am on the Statewide Research
23 Council, I guess it is, for the American Cancer
24 Society. I'm the chair of the Prevention Committee
25 for the Eastern Cooperative Oncology Group.

1 I also missed one. It's called the
2 Cancer Control Research Advisory Council or CCRAB.
3 It used to be a board, not a council, and that's --
4 I'm head of that. That's a gubernatorial
5 appointment here in Florida.

6 I'm a fellow in the American College of
7 Physicians and a fellow in the American College of
8 Chest Physicians as well.

9 Q. You mentioned earlier, Doctor, that
10 Moffitt is a not-for-profit facility. Correct?

11 A. Yes.

12 Q. Can you just generally describe for me
13 how Moffitt is funded and/or supported financially?

14 A. Yes. The Moffitt Cancer Center receives
15 approximately a hundred to a hundred and twenty
16 million dollars in revenues each year, which it uses
17 to fund the vast majority of its activities; a
18 payroll of about 40 million dollars, and obviously
19 much of that comes from that.

20 We receive now about, overall, 12 to 14
21 million dollars in grants, a half a million or more
22 a year in donations, not counting long-term
23 bequests.

24 We have several million in -- tied up in
25 what are called lines, if you will, but endowed

1 chairs and professorships that are held in the
2 University's foundation. And we get approximately
3 nine to nine-and-a-half million -- it varies from
4 eight-and-a-half through ten-and-a-half million
5 dollars -- per year from the State of Florida as a
6 general revenue appropriation.

7 Q. Okay. I think I missed something.
8 Please help me.

9 Of the 100 to 120 million dollars in
10 revenues that Moffitt sees annually, where does the
11 bulk of that revenue come from?

12 A. Patients, patient care. All of it comes
13 from patient care.

14 I'm sorry. We probably have a few
15 hundred thousand dollars a year in interest, or we
16 might sell a piece of equipment or sell a piece of
17 property, whatever; normal course events, but
18 they're all incidental to the patient care business.

19 Q. Of the 12 to 14 million that Moffitt
20 receives annually in grants, is there any one grant
21 or any one institution that stands out as being the
22 primary grant donor?

23 A. The National Institutes of Health; in
24 particular, the National Cancer Institute. We have
25 over four million in grants from the National Cancer

1 Institute; approximately another three from other
2 portions of the National Institutes of Health:
3 Heart, Lung and Blood; Allergy and Infectious
4 Diseases.

5 We also then have several million dollars
6 in other either pharmaceutical grants or other
7 government grants through the Department of Defense
8 in particular.

9 Q. You mentioned to me earlier that
10 approximately 8 to 12 percent of the patients
11 seen by the Thoracic Oncology Group were Medicaid
12 recipients. Do you know what the percentage of
13 Medicaid recipients treated by Moffitt as a whole
14 would be?

15 A. It's identical.

16 Q. It's identical, the 8 to 12 percent?

17 A. Yes.

18 Q. Do you know how that equates, Doctor,
19 to the percentage of revenue that Moffitt receives
20 annually as a result of Medicaid payments?

21 A. I don't have the -- I don't have the
22 numbers off the top of my head. The Medicaid
23 program pays a lower overall percentage than
24 several of the commercial and several of the other
25 managed-care pieces, but they're generally in

1 proportion to the proportion that we see them in the
2 institution. There are what we call more
3 "write-offs" in that area as people exhaust their
4 benefits, but -- but increasingly that's the case
5 with every form of insurance.

6 Q. What is the relationship between Moffitt
7 and the University of South Florida regarding the
8 funding or the financial relationship? How does
9 that work?

10 A. Yes. The Cancer Center was established
11 on land at the University. The Moffitt Cancer
12 Center is -- in its full name -- is a private
13 501(c)(3) corporation that holds a 50-year lease --
14 renewable lease on the land and the facilities.
15 The facilities were built by the state.

16 We're required to have an affiliation
17 agreement that ties us to the University, which we,
18 of course, do. All of us are on the faculty -- are
19 faculty members of the University, and we sit right
20 in the middle of the campus. But we have a separate
21 budgeting process; and although I nominally report
22 to the president and the dean, I don't actually
23 report to the president or the dean. I have a Board
24 of Directors -- or, actually, I have several. And
25 I have a nominal reporting relationship to the

1 chancellor, but I don't -- but -- so that's how
2 we sit there.

3 We are actually four corporations.
4 We have a parent corporation, which is the H. Lee
5 Moffitt Cancer Center & Research Institute, Inc.,
6 and it has three subcorporations. It's Hospital
7 Corporation, a separate foundation, and a --
8 what we call our screening center where we have
9 a full-service screening facility just off the main
10 campus that's a separate corporation, and we can
11 manage physician services or other services there;
12 non-hospital-based health care services through
13 that corporation, and I'm CEO of all of the four
14 corporations.

15 Q. From the financial breakdown you gave me
16 earlier, it seems that the State of Florida is the
17 third largest source of annual income into Moffitt,
18 the nine to ten million, approximately, annual, that
19 the institute receives from the State of Texas?

20 A. State of Florida.

21 Q. I'm sorry, State of Florida.

22 A. Yes. That's correct.

23 Q. Habit. I'm from Texas. It slips right
24 out. I'm sorry about that.

25 Do you know from what source of revenue

1 the State of Florida obtains the funds that are then
2 passed on to Moffitt?

3 A. Yes. The State of Florida obtains those
4 from the general revenues of the state. These are
5 general revenue funds.

6 The original funds that built our
7 building were obtained from the state cigarette tax,
8 a proportion of which was diverted for two years
9 to raise the 70 million dollars to actually
10 construct the original facility in the early 1980s.

11 Q. And, to your knowledge, does the moneys
12 obtained through cigarette taxing in Florida go into
13 the general revenues as well now?

14 A. I don't know that. The state has a whole
15 labyrinth of trust funds that the various things go
16 into, and I -- and I'm sure its purposeful -- cannot
17 track where all the various things go.

18 Q. We've discussed some of your professional
19 associations. I'd like to discuss some of your
20 publications.

21 Again, I'm sure they are voluminous, but
22 can -- do you have an idea as to how many articles
23 you have actually authored?

24 A. Yes. I usually break these out into
25 several different areas, which I'm sure you've seen

1 on my CV. I'm a bit of a purist in this.

2 The first group are what are called
3 peer-reviewed manuscripts, and these are manuscripts
4 that have been submitted, if you will, competitively
5 to various scientific journals, and which they then
6 send out to other reviewers who are supposed to have
7 equal expertise, and I think there are just over a
8 hundred articles in that category.

9 There are another group called -- I
10 think I have them as "Book Chapter Symposia and
11 Invited Presentations" in my CV.

12 And these are talks that I will give --
13 be asked to give or chapters to write, et cetera,
14 in which an editor will review them, but they don't
15 go out in a formal competitive process, per se.

16 There are many times I'll be asked to
17 participate in a symposium and the results of that
18 symposium -- the minutes of that or the text of that
19 will be published, and so I put them in that
20 section. It's an old-style pure CV, if you will, in
21 terms of what's peer-reviewed and what isn't.

22 Q. And in the more recent years, Doctor, has
23 there been one primary area of interest for the
24 peer-review articles that you have participated in?

25 A. There have been fundamentally two areas:

1 Lung cancer and behavioral studies.

2 Q. Earlier today when we discussed
3 behavioral studies, it was in the context of how a
4 doctor behaves in his interaction with a patient.
5 When you mentioned to me that your other area of
6 interest in your articles is behavioral sciences,
7 which behavior -- which mode of behavior are you
8 referring to?

9 A. I would say that three quarters of
10 those articles are related to physician behavior,
11 how that impacts patients, how we manipulate or
12 manage physician behavior. I continue to study
13 that area. We continue, also, to look at issues
14 of quality of life, what that is, how to impact on
15 that, fatigue, I -- just a whole series of issues
16 related to how the patient experiences cancer.

17 Q. Do you have -- and you may or may
18 not have an -- have a feel, Doctor, for -- of the
19 100 peer-review articles, how many of those have
20 been focused on the etiology and treatment protocols
21 for lung cancer?

22 A. 70, 75, somewhere in that ballpark.

23 Q. Within that --

24 A. The majority.

25 Q. Within that general focus of etiology and

1 treatment protocols for lung cancer, are there any
2 particular articles that stand out in your mind as
3 being the most complete and comprehensive?

4 A. I'd say there are about 30 articles in
5 there that are fairly comprehensive in what they
6 demonstrate about a particular area. There are --
7 there are another 30 or so that are very focused on
8 a particular issue.

9 Q. Is there any one that is extremely recent
10 that would be, let's say, the most recent one that
11 you've put out regarding etiology and protocols for
12 lung cancer?

13 A. Well, there are two. I mean, I'm now at
14 a different point in my career, so I tend not to
15 write the original article now. I tend to be an
16 editor and reviewer for it now, so two areas.
17 There's a book called Current -- I'm sorry -- a
18 journal called Current Opinion in Oncology, which is
19 -- which is a -- each year -- and there are four or
20 five sections. There's one on lung and mediastinum
21 -- the lung and mediastinum -- m-e-d-i-a-s-t-i-n-u-m
22 -- which is basically diseases of the chest, and I'm
23 the section editor for that. And so I see all the
24 articles that come in in that area. We select
25 people to review areas of that; then I review their

1 papers and write commentaries on that.

2 And in addition, my textbook, I think, is
3 probably the largest single collection of materials.
4 I'm coeditor of -- as you know, of the Textbook of
5 Thoracic Oncology in both its editions.

6 Q. You may actually be the recipient of
7 dozens, but of all the journals or publications that
8 you receive on a monthly basis, which ones do you
9 consider to be the most important?

10 A. I don't have -- there's, obviously, not a
11 single journal.

12 Q. Sure.

13 A. There are an array of journals that I
14 read and refer to at any given time, but probably
15 the Journal of Clinical Oncology, Journal of the
16 National Cancer Institute, Cancer Research, a
17 journal called Lung Cancer, and Chest, as well as,
18 you know, the New England Journal of Medicine and
19 the Annals of Internal Medicine. Those are the ones
20 I read on a fairly regular basis.

21 Q. Are there any particular authors of texts
22 in your field which you consider to be very
23 authoritative?

24 A. No. I think -- there are -- all the
25 people who write in the area of lung cancer are

1 all friends. I mean, we've all known each other,
2 trained together for years. I know their foibles;
3 they know my foibles. They know our biases and
4 opinions and facts and what we each know.

5 And I think all of us bring particular
6 strengths to this. So I don't consider -- at the
7 level that I operate now, I don't consider anybody
8 authoritative or definitive more than anybody else.
9 I mean, each of us brings a perspective and
10 understanding of a voluminous literature to bear,
11 and we each present that in somewhat different ways,
12 but I -- but I don't think there's anything -- I
13 mean, I don't turn to anything as authoritative or
14 definitive, per se. I mean, I don't -- there's not
15 a source when I say, "Oh, I have to know this; I
16 have to go -- this is what I turn to," and "that's
17 what I go to." There is no such journal, book or
18 anything else. It's a summation of just thousands
19 of things. That's the whole task, is keeping up
20 with all those thousands of things.

21 Q. You've mentioned several medical
22 professional associations and organizations
23 that you're a member of. Are there any other such
24 organizations that have a more -- a business focus
25 that you are also involved in?

1 A. Yes. I'm in the American College of
2 Physician Executives. Oh, what else am I in?

3 I think any other -- any number of trade
4 groups in the hospital area, American Hospital
5 Association, we're part of. There's several.
6 There's -- and many of those, we're members because
7 I'm the CEO and they -- and they come in in that
8 fashion, and I participate in and out.

9 I participate heavily in the health care
10 -- the Advisory Board, a health care consulting
11 group that has become very popular as a source of
12 ongoing business education in the field, primarily
13 in that area.

14 Q. Are you a member of any organizations or
15 interest groups that have, as one of their
16 objectives, to discourage smoking in society?

17 A. Sure. I'm a member of the Moffitt Cancer
18 Center. We actively try to discourage smoking.

19 Q. Any other organizations or entities that
20 has that as one of their goals or objectives?

21 A. Yes. The -- actually, that's not a
22 stated goal or objective of the Cancer Center, but
23 I was a member of -- I think I still am -- as a --
24 I'm trying to think of the name of it in Florida.
25 In New York it was called Tobacco or Work --

1 Governor's Committee on Tobacco or Health, and
2 I also was a member of that in New York.

3 And there's a similar committee in
4 Florida, and I'm -- I've been a member of that as
5 well.

6 Q. Is that a committee that you're appointed
7 to by the Governor?

8 A. Yes. And then the Cancer Control
9 Research Advisory Council. It has as -- which
10 writes the Florida Cancer Plan -- has enunciated
11 smoking cessation as one of its major objectives.

12 Q. Can you tell me, Doctor, on how many
13 previous occasions have you given deposition
14 testimony?

15 A. In tobacco-related litigation or any?

16 Q. No, Doctor. I'm not limiting it to
17 tobacco cases. Just how many prior depositions have
18 you given?

19 A. Over about a 20-year period, I would say
20 maybe 20 or 30 times.

21 Q. How many times, if at all, Doctor, have
22 you ever testified live at trial?

23 A. Four or five times over that period of
24 time.

25 Q. Of these four to five times you have

1 testified at trial, has your testimony always been
2 in the context of being an expert witness?

3 A. Yes. That's correct. I'm sorry. Yes.
4 In the testimonies, yes. There have been a couple
5 of cases with depositions where I've been the
6 treating physician, but that's where someone was
7 bringing a suit against someone else and I was the
8 treating physician for that.

9 Q. Correct. Of those 20 to 30 depositions,
10 would it be correct to say that the vast majority of
11 them have been testimony you've given as the expert
12 witness capacity and a much smaller percentage of
13 those where you were a treating physician?

14 A. Yes. 98 to 2. I mean, a very, very
15 small percentage for treating physician.

16 Q. Do you keep, Doctor, anywhere within your
17 records at your office, a list or some compilation
18 of information on the different cases you've
19 testified in?

20 A. No.

21 Q. Have you ever been a party to litigation?

22 A. No.

23 Q. I saw you frown. Meaning -- let me --

24 A. I was trying to think -- yeah. I
25 was just trying to think what you meant by that.

1 Q. I understand your confusion.

2 A. I thought I understood it.

3 Q. Well, to rephrase: Have you ever been
4 the one who sued someone else or the one being sued?

5 A. I think I had a \$200 Small Claims
6 Court against a car repairman in Troy, New York,
7 at sometime in the past. That was my one experience
8 as the claimant. I think once a patient issue was
9 raised on side effects of treatment, but it was
10 never -- it never came to case. It was dismissed
11 on initial review on -- over 15 years ago.

12 Q. Was there ever actually a lawsuit filed?

13 A. No.

14 Q. Okay.

15 A. I've never had a lawsuit filed. I never
16 instituted one or been -- or been part of one.

17 Q. So you've never had any type of a medical
18 malpractice case instituted against you?

19 A. No.

20 Q. You may have just told me this, but let
21 me ask again. I may have forgotten.

22 Of the four to five times that you
23 testified at trial, each time you were serving in
24 the capacity of an expert witness?

25 A. That's correct.

1 Q. Okay. Do you recall when that last
2 occasion would have been where you actually
3 testified at trial?

4 A. Probably six or seven years ago.

5 Q. Okay. Have you given any trial testimony
6 since you relocated to Florida?

7 A. I don't believe so.

8 Q. All of your trial testimony would have
9 been when you were in New York?

10 A. That's correct.

11 Q. Were any of those four to five trial
12 testimonies -- or in those four to five cases in
13 which you testified at trial, do you recall, Doctor,
14 whether or not you offered any expert opinions
15 regarding any smoking and health issues?

16 A. Actually, I believe I did not. I think
17 these were -- none of those were lung cancer cases.

18 Q. Okay. Without going into the details of
19 the four or five individually, would it be correct
20 to say that your trial testimony has always been in
21 a medical malpractice type of case?

22 A. Yes. That's correct.

23 Q. Okay. But none of them have been lung --
24 lung cancer cases?

25 A. Trial testimony has not, but the vast

1 majority of the other cases and the depositions have
2 been in lung cancer.

3 Q. Okay. And I'll try to differentiate
4 between the two and be specific with you.

5 A. Yes.

6 Q. Of the trial testimony you've given, what
7 was the nature of them, if they weren't lung cancer
8 cases, if you can recall?

9 A. Most of them were failure to diagnose or
10 failure to pursue clinical findings, and they were
11 in the general context of a medical oncologist.
12 And, actually, I would pretty much review whatever
13 was -- I was asked to do in previous years. And
14 probably for the last 8 to 10 years have only --
15 I just, by dint of the amount of time I have,
16 only accepted lung cancer cases, since that's my
17 overwhelming area of expertise.

18 Q. Before today, when was the last time you
19 gave a deposition?

20 A. Six to nine months ago, somewhere in that
21 ballpark.

22 Q. Okay. And what case was -- what was the
23 nature of that case and the names of the parties, if
24 you can recall?

25 A. I don't remember the names of the parties

1 or the attorneys. It was a failure to diagnose lung
2 cancer.

3 Q. And you don't recall which attorneys
4 retained you in that matter?

5 A. No, I don't.

6 Q. You've established for me that none of
7 your trial testimony has ever been about a lung
8 cancer case but that several of your deposition
9 testimonies were. Correct?

10 A. I may have -- I may -- may I make a
11 correction to that?

12 Q. Please do.

13 A. I think -- for several years, I was asked
14 by the U.S. Attorneys in -- around the country to
15 testify in cases, and I think that one of them in
16 the state of Washington was one that I could not
17 return for trial to, and so I think they took -- and
18 that was a lung cancer case and -- it was not a
19 causation case, but it was a failure to diagnose
20 case, nature of the disease, et cetera.

21 And I believe they took videotaped
22 testimony. I believe that was played at trial, and
23 I believe that was cited -- that was put into the
24 record by the judge.

25 And then the U.S. Attorneys were -- asked

1 me to do several cases after that around the
2 country, but I think -- so I think there was one
3 trial case, but it was a video dep -- it was video
4 testimony rather than a live testimony.

5 Q. And when you say "U.S. Attorney," who
6 specifically or what branch of the government are
7 you referring to when you say you were retained by
8 the U.S. Attorney? Do you know?

9 A. Somebody who would -- I think it was the
10 Department of Justice. It was a U.S. Attorney for
11 Western Washington or the U.S. Attorney for the
12 Eastern District of Oklahoma or someplace else. I
13 didn't -- you know, I didn't pay -- or U.S. Attorney
14 for Philadelphia or whatever, that would call and
15 say, "Can you assist us with this case?"

16 Q. Do you have any documentation within your
17 custody or control, Doctor, that would give any more
18 specific information regarding that case in
19 Washington?

20 A. I doubt it. I doubt it. Usually,
21 my secretary is more than happy to take these
22 voluminous files that are sent and assumes the case
23 is settled, and they -- they join the recycling bin
24 at that point in time.

25 Q. You've told me that none of your prior

1 trial testimony has regarded smoking and health
2 issues. What about your prior deposition testimony?
3 Have any of those, to your recollection, entailed
4 smoking and health issues?

5 A. I'm trying to think how I want to -- want
6 to phrase this. Many of them have included, as part
7 of the deposition, discussions of smoking behaviors,
8 of smoking as a causative factor in lung cancer, et
9 cetera.

10 But the cases themselves have not been
11 what you would traditionally describe as tobacco
12 litigation cases where the issue at hand was
13 causation. It was always the person having lung
14 cancer; and in the process of describing that
15 disease and how they got it, et cetera, the issues
16 of smoking would come up during that; and I would,
17 of course, discuss those.

18 Q. Of the four or five times that you have
19 testified at trial, do you know what percentage of
20 those cases you were testifying on behalf of the
21 plaintiff versus testifying on behalf of the
22 defendants?

23 A. I think it's almost 50-50. I really -- I
24 mean, actually, I had one embarrassing case where I
25 was asked by both sides and did not recognize it

1 until a couple of weeks into it, that I had been
2 asked by both sides and -- it wasn't until the
3 materials arrived. So I really don't distinguish
4 between the two. I do whoever asks.

5 Q. And the same question regarding your
6 deposition testimony?

7 A. Same -- absolutely the same. I make
8 no distinction. I mean, one could be 60-40, but I
9 -- you know, it's not because I know that or have a
10 policy of that.

11 Q. Does Moffitt have a policy regarding its
12 staff members participating in litigation?

13 A. No. Actually, the -- my -- the bulk of
14 my salary comes from the State of Florida, actually
15 through my role as a faculty member, and Moffitt
16 reimburses the State for my time, and the State of
17 Florida has no -- no policy. If I take time off to
18 do something, I take that as personal leave but --
19 as long as I'm not using state employees, they're --
20 they don't -- they have no policy against it.

21 Parenthetically, the Cancer Center was
22 very supportive of participating in this case, as
23 you might imagine.

24 Q. That's not a surprise. Is there a policy
25 or prohibition preventing staff members at Moffitt

1 from consulting for any particular industries or
2 groups?

3 A. No, there's not.

4 Q. Is it --

5 A. I'm sorry. There is a -- we have
6 a conflict of interest policy, which extends
7 through all of senior management and -- if we are
8 consultant, board member, and made investor over
9 5 percent, blah-blah-blah -- the usual litany
10 of conflict-of-interest documents -- in any
11 organization or company that is doing business
12 with or trying to tempt into contract with the
13 Cancer Center, then we must announce that at the
14 appropriate Board meeting, both verbally and in
15 writing, and seek the approval of the Board to
16 continue in that, but I personally avoid all such
17 conflicts that I know about, so I'm not in that
18 position.

19 Q. Is there any particular policy or
20 prohibition regarding staff members at Moffitt from
21 consulting with the tobacco industry?

22 A. No.

23 Q. What agreement, if any, have you reached
24 with plaintiff's counsel or the State of Florida
25 regarding your reimbursement for your consulting

1 work and your deposition testimony and potential
2 trial testimony in this matter?

3 A. I charge a flat rate of \$300 per hour for
4 all three.

5 Q. Do you know, to date, approximately how
6 much time you have invested into the consulting work
7 you've done in this matter?

8 A. Somewhere between 10 and 12 hours. I
9 hurt myself there. I'm a very fast reader.

10 Q. You're lucky.

11 A. No, I'm not. Then I can read more.
12 That's --

13 Q. Is there any other remuneration or
14 promise of any other type of remuneration other than
15 the straight financial arrangement of \$300 an hour
16 paid to you?

17 A. No, ma'am. No.

18 Q. Doctor, did you bring any documents with
19 you today to this deposition?

20 A. Yes, I did.

21 Q. What documents did you bring with you?

22 A. I brought a series of materials that were
23 provided to me by the plaintiff's counsel -- or my
24 counsel, I guess, in this instance. I'm sorry.

25 Q. Do you have them with you? Can you

1 identify them for me, or do you have an index of
2 them?

3 A. I have them behind me if I could -- I'll
4 be happy to pull them out.

5 Q. I have no problem with that, but we may
6 need to accommodate our videographer. May he --

7 THE VIDEOGRAPHER: Please go ahead.

8 Q. You may need to -- if you have to move
9 too far away, you may have to remove your
10 microphone.

11 MR. SCHLESINGER: Well, if you remember,
12 why don't you just tell them what they are. I
13 don't think you have to --

14 THE WITNESS: There's a --

15 MR. SCHLESINGER: -- trot them all out.

16 A. -- series of depositions of Dr. David
17 Burns, B-u-r-n-s, in a 1994 case in -- of Yvonne
18 Rogers versus R.J. Reynolds Tobacco Company, et al.

19 There is a -- and that includes several
20 volumes.

21 Q. And that's the transcript of Dr. Burns'
22 deposition?

23 A. Yes. That's correct. And then there
24 is a deposition by Dr. Mark Green in the State of
25 Mississippi case of Mike Moore, the Attorney General

1 for the State of Mississippi, versus American
2 Tobacco Company, et al., and those are the materials
3 that I read through.

4 I was also sent a series of materials,
5 a deposition by Sir Peter Doll, both videotape and
6 written copies of the deposition. But it became
7 apparent to me, in going through the initial
8 materials and in reading those, that they were
9 repetitious, that I knew the information, and so I
10 did not review them in preparation. I do have them
11 here.

12 Q. Were you furnished by plaintiff's counsel
13 any other documents other than these three
14 deposition transcripts to review in preparation for
15 your deposition?

16 A. No. I was -- no. I think I was just
17 given a copy of your subpoena. I think that's the
18 only other thing that I received.

19 Q. Have you ever met Dr. Burns?

20 A. No, I have not.

21 Q. Have you had any conversations with
22 Dr. Burns at all prior to your testimony today?

23 A. No, I have not.

24 Q. Same for Dr. Green. Have you ever met
25 or had any discussions with Dr. Green prior to your

1 deposition testimony today?

2 A. Dr. Green is a good friend. We trained
3 together for part of our training. He was center
4 director at the University of California at San
5 Diego. He is currently the center director at the
6 Medical University of South Carolina in Charleston,
7 of their Cancer Center. We see each other
8 frequently at meetings. We've -- I don't think
9 we've ever coauthored a paper together, but we've
10 certainly sat on innumerable panels and review
11 groups together. I've not discussed this case with
12 him, however.

13 Q. Where did the two of you train together?

14 A. We spent at least one year -- it might
15 have been two -- at the National Cancer Institute in
16 Baltimore. Our time there overlapped. He also is a
17 lung cancer expert, and we -- it's a small -- it's a
18 small fraternity or kind of -- but I guess it's not
19 a fraternity since there are women in it, but
20 a small group internationally. I mean, the whole
21 international organization only has about 1500
22 people in it, so --

23 Q. I understand that you have not discussed
24 your testimony with Dr. Green. Has Dr. Green
25 discussed with you anything about the deposition he

1 gave in the Mississippi case?

2 A. No. No. In fact, I had not known he had
3 done that until I received a copy of the deposition.

4 Q. You have outlined for me, Doctor, what
5 attorneys have given you to review prior to your
6 deposition. Did you review any other type of
7 documentation or text or articles or journals on
8 your own in preparation for this deposition?

9 A. No, ma'am. I carry them around in my
10 head.

11 Q. You were not asked to review any
12 particular Surgeon General Reports or anything of
13 that nature in preparation for your testimony?

14 A. No, ma'am. Excuse me. I'm sorry.
15 I believe that, in addition to Sir Peter Doll's
16 testimony, there was a copy of the Surgeon
17 General's Reports and another article in the
18 materials they sent, but I did not read them or
19 use them in preparation for this. I'm generally
20 familiar with their content.

21 Q. Okay. Through documents previously
22 produced to me, it was my understanding that you had
23 been provided with a report called "The Report on
24 Policy Aspects of the Smoking and Health Situation
25 in the USA." Is that an article that you recall

1 reviewing?

2 A. No. I received it, but I didn't review
3 it.

4 Q. Similarly, Doctor, did you also receive
5 an article entitled "Cartoons, Cotton Candy and the
6 Marlboro Man"?

7 A. Yes, I did.

8 Q. Did you review that article?

9 A. No.

10 Q. When were you first contacted, Doctor, to
11 -- or were first approached about the possibility of
12 serving as an expert in this matter?

13 A. I would have to guess about three or four
14 months ago.

15 Q. Who contacted you?

16 A. I believe Attorney Schlesinger, and there
17 were two other attorneys present whose names I don't
18 remember off the top of my head. I'm sure counsel
19 could give you their names, but I don't remember
20 them offhand.

21 Q. Okay. Were you already familiar with
22 Mr. Schlesinger, or do you know how he came to
23 contact you?

24 A. No. I understand that the State of
25 Florida, in its preparation of this suit, brought

1 together a team of attorneys from around the state,
2 and it is my understanding that someone in state
3 government or the Governor's office suggested my
4 name, among others, as people who -- as individuals
5 who would potentially lend support to the case
6 scientifically or medically, and I was contacted in
7 that context, is what I believe -- what I was told
8 and what I actually believe.

9 Q. Of the attorneys that have contacted you
10 and worked with you in preparation for your
11 testimony, had you ever worked with any of those
12 attorneys before?

13 A. No, ma'am.

14 Q. Were you originally contacted by phone?

15 A. I believe a call was made to my office to
16 set up an appointment, but I think the initial
17 contact was actually a meeting in my office.

18 Q. Okay. And -- this may be repetitious.
19 Do you recall who attended that meeting, whether
20 they were attorneys or not?

21 A. Other than Mr. Schlesinger, no. I don't
22 remember their names.

23 Q. And how many such meetings, whether they
24 were in your office or at other locations, have you
25 had with counsel?

1 A. I had one meeting with counsel -- I had
2 that first meeting in my office. I had a separate
3 meeting a week or 10 days ago with Mr. Schlesinger,
4 and then we met briefly before coming in here; had
5 coffee and donuts and -- I guess that counts as a
6 meeting.

7 What's the term for that, "billable
8 hours"? Isn't that how that works? I'm sorry.

9 Q. At the initial meeting, what was the
10 nature of the conversation? What were you asked to
11 do, if anything?

12 A. Yes. The -- at the initial meeting,
13 the attorneys represented themselves as part of the
14 group that had come together to assist the State
15 of Florida in the handling of this case. I was
16 familiar with the case itself. I was familiar with
17 the political issues behind it. I was, obviously,
18 familiar with the litigation. I knew a group had
19 been chosen.

20 They indicated that I had come to their
21 attention, for obvious reasons, and would I be
22 willing to take the time to review the materials,
23 testify in the case, and et cetera, and I said
24 "yes." -- It was actually a relatively short meeting.

25 Q. And then you said there was a second

1 meeting approximately 10 days ago?

2 A. Yes.

3 Q. Can you describe the nature and general
4 context of that meeting?

5 A. Yes. Mr. Schlesinger wanted to know if I
6 had received the materials, had read them. Did I
7 have any questions? And we discussed, actually, in
8 very general terms, what was likely to be the thrust
9 of the questions, and I gave him what have -- my
10 opinions are about those. He seemed satisfied, and
11 that was it. You know, we just met for a very --
12 actually, again, less than an hour.

13 Q. Who was in attendance at the second
14 meeting?

15 A. Just -- I believe just he and myself.

16 Q. Okay. Did you, by the end of that second
17 meeting, Doctor, come to an understanding of what
18 your scope of testimony would be in this matter,
19 what type of opinions you would be asked to render?

20 A. I -- I don't -- I'm not sure. I think
21 the limitations placed on it, between the meetings
22 -- and I'm not sure they were that explicit --
23 related to the issues of speaking to the disease and
24 overall issues related to its impact on individuals
25 in society and with respect to my expertise in the

1 field as a whole, the degree, to my knowledge, of
2 how -- the causation issues, but that I would not be
3 testifying specifically to specific scientific data
4 on causation, which I have not been the -- I have
5 not produced and have not specifically reviewed for
6 this.

7 Q. Okay. During the course of this
8 deposition, I will ask you a series of questions and
9 you will have an opportunity to explain to me all of
10 your opinions in detail.

11 A. Um-hum.

12 Q. But at this point, if I could sort of get
13 a bullet format of what areas of opinions you intend
14 to render, it would be helpful. And I'll start by
15 asking -- and please let me know if I leave anything
16 out, Doctor.

17 Is it your understanding that you will be
18 -- or do you feel prepared to render opinions
19 regarding the diagnosis of lung cancer?

20 A. Yes.

21 Q. Is it your understanding, and are you
22 prepared to render opinions regarding the treatment
23 of lung cancer?

24 A. Yes.

25 Q. Are you prepared to render opinions

1 regarding the management of a cancer patient?

2 A. Yes.

3 Q. Are you also prepared, and do you intend
4 to render opinions regarding the costs -- and I'm
5 referring to the monetary costs -- affiliated with
6 the treatment and management of a cancer patient?

7 A. Yes.

8 Q. Will you be offering opinions regarding
9 causation of lung cancer as it relates to smoking
10 and the cause of lung cancer?

11 A. I suspect that I will in the course of my
12 testimony, yes.

13 Q. You mentioned to me earlier that you have
14 reviewed the deposition transcript of Dr. Mark
15 Green. Is that correct?

16 A. Yes. That's correct.

17 Q. Then you're aware that Dr. Green
18 refrained from offering any causation testimony as
19 it relates to the causation factors between -- that
20 may exist between smoking and lung cancer. Correct?

21 A. I believe I remember that, yes.

22 Q. And are you telling me, then, that,
23 unlike Dr. Green's testimony, you are prepared to
24 testify regarding the causative relationship between
25 smoking and lung cancer?

1 MR. SCHLESINGER: Counsel, he's already
2 told you that.

3 MS. ECKELS: I just want to make sure
4 I understand --

5 MR. SCHLESINGER: Dr. Green's --
6 Dr. Green's testimony to the contrary
7 notwithstanding, which is neither relevant nor
8 material to any of the opinions which he has,
9 and therefore I object to your question, as
10 he has already told you that he is going to
11 testify as far as causation is concerned.

12 BY MS. ECKELS:

13 Q. And, Dr. Ruckdeschel, I'm going to
14 endeavor, to the best of my ability, not to repeat
15 myself during the course of the day. But, from time
16 to time -- I just want to make sure I understand
17 what you're telling me.

18 A. Yes.

19 Q. Are you prepared to render opinions,
20 Doctor, on the causative relationship between
21 cigarette smoking and lung cancer?

22 A. Yes, I am, and I'm prepared to speak
23 to those issues that I see them, as a clinician,
24 as someone who has been involved in basic scientist
25 -- as someone who has been intimately involved in

1 this for 20 or 25 years. I think it's a fairly
2 straightforward relationship. I will speak to that.

3 I cannot speak to the individual animal
4 or data or the individual epidemiologic studies, but
5 the summation of all of those that I have reviewed
6 and been part of for the last 20, 25 years have
7 led me to opinions about causation that I think
8 are fairly straightforward.

9 Q. You've told me that you're prepared to
10 render opinions about diagnosis, treatment,
11 management, costs, and causation. Are you prepared,
12 and do you intend to offer expert opinions on any
13 other aspects of a smoking and health issue?

14 A. Do you have any in mind? I'm not sure
15 I --

16 Q. Absolutely. Let me go through a list --

17 A. Sure.

18 Q. -- and not to -- perhaps this will help
19 narrow things down.

20 Do you intend, Doctor, to offer any
21 expert opinions, or do you consider yourself an
22 expert in surgery?

23 MR. SCHLESINGER: Which is it that you
24 want to know, Counsel? Do you want to know
25 whether or not he considers himself an expert

1 or do you want to know whether or not he
2 intends to offer opinions in that regard? Your
3 question is compound. I think you ought to
4 decide which of the two questions you want
5 answered.

6 MS. ECKELS: I'll answer it -- I'll ask
7 them both separately.

8 BY MS. ECKELS:

9 Q. I guess I was assuming that if you didn't
10 consider yourself an expert, you wouldn't offer an
11 expert opinion, but let me ask them separately.

12 Do you consider yourself an expert in the
13 area of surgery?

14 A. Yes, in a very unique way as a
15 non-surgeon, in that management of lung cancer is
16 heavily involved with surgery, thoracic surgery in
17 particular. I was the -- wrote the paper that led
18 to the founding of the lung cancer study group,
19 which was a group of thoracic surgeons formed
20 by the National Cancer Institute.

21 When those cooperative studies from our
22 early work in Albany were finished, I became the
23 executive officer of the group, and so I've had a
24 unique -- almost unique role as a medical oncologist
25 in having to review, lead, the long scientific

1 discussions -- tedious scientific discussions about
2 the nuances of surgery in the management of lung
3 cancer.

4 Q. Being that you consider yourself an
5 expert in the field of surgery, do you intend to
6 offer opinions -- expert opinions in this matter
7 regarding thoracic surgery as it relates to the
8 treatment of lung cancer?

9 A. Yes, I do. But, again, not to the
10 specifics of the -- of how I would perform the
11 procedure, since I don't perform the procedure.
12 But when is the procedure indicated, what types of
13 surgery, under what ground rules and what are the
14 expectations that one should have from that and what
15 are the nuances of that therapeutic modality as it
16 applies to the management of lung cancer patients.

17 Q. Do you consider yourself an expert in the
18 area of pathology?

19 A. If I could give exactly the same reply
20 and substitute the word "pathology" for thoracic
21 surgery -- again, in my role, both in the Lung
22 Cancer Study Group and in the Eastern Cooperative
23 Oncology Group, I've had to review pathology. I
24 review it every week, every day, literally in my
25 practice. How it fits -- I have published in the

1 area of pathology and nuances of pathology in lung
2 cancer. And, in fact, Dr. Gazdar, who I did a good
3 portion of my sabbatical with, is a pathologist, and
4 those issues -- and, in fact, have published again
5 in the issues of immunohistochemical -- i-m-m-u-n-o-
6 h-i-s-t-o, chemical -- variations in lung cancer and
7 its effect on prognosis.

8 So, again, although I am not a board
9 certified pathologist, don't do pathology every day,
10 I have an extensive understanding of its -- of its
11 role and its impact and would consider myself an
12 expert in that area.

13 Q. And, similarly, do you intend to offer
14 expert opinions regarding pathology in this matter?

15 A. Yes.

16 Q. Do you consider yourself an expert in the
17 field of epidemiology?

18 A. I would give the same answer. Do you
19 want me to track through that? It's -- it's the
20 same thing. I use it as part of my work in this,
21 and have considerable familiarity with it and have
22 worked closely in the epidemiologic aspects of this
23 disease.

24 Q. Are you prepared to give expert testimony
25 regarding epidemiology in this matter?

1 A. Again -- yes, but only so far as it
2 impacts on the disease itself, not specific to the
3 techniques of epidemiologic research.

4 Q. Do you consider yourself an expert in the
5 field of statistics?

6 A. Same answer.

7 Q. Do you consider yourself to be an expert
8 in the field of psychiatry?

9 A. The broad field of psychiatry, no. As
10 far as the psychological and psychiatric impact of
11 cancer on the patient, on the staff, on the family,
12 the impact of the disease, both psychiatrically and
13 psychologically, yes, I think I am an expert in that
14 area, and I will be prepared to offer testimony in
15 that regard.

16 Q. Do you consider yourself an expert in the
17 field of pharmacology?

18 A. Really, same answer. I mean, I've worked
19 in the area of drug development, drug design, drug
20 testing, all of which are parts of pharmacology. I
21 will not speak to specific issues of pharmacologic
22 tests, nor am I a pharmacologist, specifically, by
23 training, but have long experience in how to apply
24 those results to the field of lung cancer and have
25 published in that area as well.

1 Q. Do you consider yourself to be an expert
2 in the field of psychopharmacology?

3 A. Tell me what you mean by
4 "psychopharmacology." That's a --

5 Q. Well, in my layman's --

6 A. Yes, that's --

7 Q. -- terms, a psychopharmacologist is a
8 person who is an expert in the field of drugs which
9 are prescribed to an individual for the treatment of
10 a mental disorder or an expert in the field of the
11 use of drugs that may have a mind-altering effect.
12 Using that, perhaps, rough working definition, would
13 you consider yourself an expert in that field?

14 A. No.

15 Q. Do you consider yourself an expert in the
16 field of addiction or in the treatment of substance
17 abuse?

18 A. No. I've had experience with it as a --
19 in my internal medicine side of what I do, but not
20 as an expert in that area.

21 Q. Since you do not consider yourself an
22 expert in that area, is it accurate to say that you
23 do not intend to offer expert opinions regarding
24 addiction issues?

25 A. To the extent that smoking behaviors are

1 addictive and that that addiction is part of the
2 problem in smoking cessation, I will discuss those
3 and offer expert opinion in those areas. With
4 respect to a broad expertise in addiction behaviors,
5 I will not.

6 And I think I should amend my answer on
7 psychopharmacology, really, to the same; that, as
8 they impact on smoking behaviors in patients who
9 go on to get pulmonary diseases, cardiovascular
10 diseases, vascular diseases and lung cancer, I am
11 familiar with those, issues related to those. I am
12 just not -- I have not had as broad a training in
13 those areas and have not published in those areas
14 where I have in several of the other areas. But to
15 the effect -- to the extent that they impact on the
16 individual risks that a patient accumulates and how
17 they accumulate those risks, I will -- I feel I can
18 offer expert opinion in that and will do so -- or
19 and I'm prepared to do so.

20 Q. And that's in the field of
21 psychopharmacology?

22 A. Yes, as well as the addiction behaviors.

23 Q. Okay. Have you ever published on the
24 subject of addiction?

25 A. No.

1 Q. Have you ever given any presentations,
2 speeches, or taught any courses on the subject of
3 addiction?

4 A. I've given -- parts of numerous talks
5 have been on smoking behaviors and difficulties with
6 cessation. That's part of the introduction to
7 several talks on occupational causes of lung cancer
8 and also to the topic itself. I mean, it's a
9 frequent introductory topic for me and -- as I lead
10 into the disease.

11 Q. You've mentioned to me earlier in the
12 deposition, Doctor, that you have always had an
13 interest in behavioral sciences and have been a
14 participant in various studies that relate to
15 behavioral sciences. Correct?

16 A. That's correct.

17 Q. Have you been a participant in any
18 behavioral studies that relate to addiction?

19 A. Smoking addiction, yes.

20 Q. When was the last time you participated
21 in a study that was -- whose -- which focused on
22 smoking addiction?

23 A. Actually, I'm currently participating
24 in that. We are -- we have brought a new faculty
25 member on board whose whole work is in the area of

1 smoking cessation, and I will be collaborating with
2 him peripherally in -- in those works.

3 Q. And who is this individual?

4 A. Dr. Thomas Brandon, B-r-a-n-d-o-n.

5 Q. And what type of physician is
6 Dr. Brandon?

7 A. He's a psychologist. He's not a
8 physician, so he's a Ph.D.

9 Q. Thank you. Has -- is there a name for
10 this study that -- so I can refer to it by name?

11 A. No. No.

12 Q. Has the study that you've just mentioned
13 with Dr. Brandon -- has that begun?

14 A. No. He arrives --

15 Q. When is it --

16 A. He arrives July 1st. In the process
17 of his -- I'm very -- maybe it's -- be -- have
18 specificity here.

19 It is my firm belief, as Director, that
20 our efforts in smoking cessation need to be at the
21 forefront. And rather than have that be solely a
22 treatment option which we offer to patients, which
23 we have done for many years, we have elected to
24 invest in smoking cessation research, per se, and
25 I've -- and so that's -- those are the

1 collaborations with Dr. Brandon. I'll probably -- I
2 will be peripherally involved in the actual research
3 for that, but have been -- many of the issues
4 related to addictive behaviors around tobacco are
5 some that I've been intimately involved in, in those
6 behavioral studies over the years.

7 Q. Do you consider yourself an expert in the
8 area of consumer behavior?

9 A. Only to the extent I'm -- that I'm a
10 consumer. No, I'm sorry. I take that back. Within
11 the area of -- of the medical consumer, I have now
12 had to become an expert on that, as we attempt to
13 market and differentiate an academic health center
14 product in the marketplace. And so I've had
15 numerous talks, lectures, readings in the area of
16 marketing, especially as to how it relates to
17 medical marketing and how consumers react to certain
18 messages and the techniques of focus groups and how
19 they can be employed and used.

20 So, to that extent, yes, I'm prepared to
21 offer expert opinion as to what I have seen and
22 learned and experienced and my own opinions in that
23 area.

24 Q. I believe I understand what you're
25 telling me, and that is that you consider yourself

1 an expert in the field of consumer behavior and
2 marketing of -- I'll use your own term, "medical
3 product." Correct? I think I borrowed your term.

4 A. Yeah. If I did, and if that was
5 misleading, let me make sure I expand upon that.

6 It's not medical products, per se. It
7 is the broad range of how people respond to medical
8 messages. It, in fact -- there is a -- that field
9 within the area of public health is called "social
10 marketing." I now sit on the editorial board of
11 Social Marketing Quarterly, and that's an integral
12 part of research that we're doing in our -- some
13 further physician behavior/patient interaction
14 studies that we're doing.

15 And so I have, actually, a fairly good
16 understanding and a fairly good expertise in the
17 area of social marketing and how people are
18 influenced, whether you call it marketing or
19 advertising, or whatever else. But the scientific
20 term, if you will, "social marketing," is the one
21 I would apply to that. And, yes, I think I have
22 expertise in that area and I'm prepared to offer
23 opinions to that effect.

24 Q. Do you consider yourself to be an expert
25 in the area of consumer behavior and marketing as it

1 applies to tobacco products?

2 A. I consider that part of the broader
3 answer that I just gave; and so within that context,
4 yes. It's certainly an example that we use many
5 times.

6 Q. Do you consider yourself an expert in the
7 area of cigarette design or manufacturing?

8 A. Only to the extent of how it impacts on
9 the patient. We've had extensive discussions over
10 the years about the differences in histology we're
11 seeing in lung cancer and the potential role of
12 filters in performing that -- in causing that. I
13 have no specific knowledge about how cigarettes are
14 manufactured or specifically designed, other than
15 having seen it on television. But other than that,
16 I have no specific expertise.

17 But how the changes that have been --
18 however they've been done, however they -- how they
19 impact on people, yes, as part of their difficulties
20 in stopping smoking and part -- also, how they
21 affect the type of lung cancer they get. Yes, I am
22 prepared to -- I have expert opinions on those and
23 will -- and I'm prepared to testify to that.

24 Q. Do you consider yourself an expert in the
25 field of medical economics?

1 A. Really, the same answer. As a CEO, yes,
2 I've -- I better be, or I'm in trouble, so yes.

3 Q. Do you --

4 A. And I'm prepared to testify to the areas
5 of medical economics as they pertain, primarily, to
6 the provision of cancer care.

7 Q. Do you consider yourself to be an expert
8 on the operation and economics of the Florida
9 Medicaid system?

10 A. I think I have a broad understanding of
11 it and some very specific understandings and
12 interactions with it. There are, obviously, details
13 of the law that I am not familiar with on a
14 day-to-day basis; but as CEO of an institution in
15 Florida, have to have a significant understanding of
16 it. I chaired a meeting of the Cancer Center
17 directors around the state, with the state Medicaid
18 agency, attempting to establish an alternative
19 services network in the Medicaid system with them
20 and at their request. So I have quite a broad --
21 as good an understanding as anyone of the Florida
22 Medicaid system.

23 Q. And are you -- similarly, are you
24 prepared to render expert opinions in this case
25 regarding the economics of the Florida Medicaid

1 system?

2 A. Yes, as they pertain to the care of the
3 patient with cancer. I, obviously, have no
4 knowledge of how those impact on other areas.

5 Q. And I believe you indicated to me earlier
6 in our initial general discussion that you do
7 consider yourself to be an expert and do intend to
8 render opinions regarding the costs affiliated with
9 the treatment of a cancer patient?

10 A. Absolutely.

11 Q. Okay. Well, I think I've done my best to
12 try to give you sort of a laundry list of areas in
13 which you are an expert. Doctor, have I failed to
14 mention any particular area in which you consider
15 yourself an expert and for which you are prepared
16 and intend to render expert opinions in this matter?

17 A. No. I think that the other areas that
18 are traditionally included here are the areas of
19 radiation oncology and radiology, per se, and the
20 answer would be the same as for thoracic surgery and
21 pathology. I'm intimately involved in their use,
22 although I'm not board certified in either.

23 Q. Would you include any other areas,
24 Doctor, in which you consider yourself to be an
25 expert and prepared to render expert opinions?

1 A. I don't believe so. Not that I remember
2 at this time.

3 MS. ECKELS: I'd like a quick rest room
4 break. Is that okay?

5 MR. SCHLESINGER: Great with me.

6 MS. ECKELS: Very good. Let's go off the
7 record for a few minutes.

8 THE VIDEOGRAPHER: It's 11:40. We're off
9 the record.

10 (There was a recess from 11:40 a.m. until
11 11:53 p.m.)

12 THE VIDEOGRAPHER: It's 11:53. We're
13 back on the record.

14 BY MS. ECKELS:

15 Q. Dr. Ruckdeschel, do you now or have you
16 ever smoked?

17 A. No, other than the, you know, half a
18 dozen 12-year-old cigarettes, but no.

19 Q. Do any of your family members or friends
20 now -- or have they ever smoked in the past?

21 MR. SCHLESINGER: Well, Counsel, I have
22 an objection to that question, and that being
23 that his family and his friends have a right of
24 privacy. That question is invasive of their
25 right of privacy. If he prefers to answer that

1 question, that's fine. But if he doesn't, I
2 think that privilege can be asserted to allow
3 him not to ask -- answer.

4 THE WITNESS: My son continues to smoke.
5 My son was initially attracted to Camels;
6 thought the Joe Camel ads were cute. He is now
7 fully addicted to cigarette smoking; has had a
8 very difficult time stopping on the times he's
9 made an attempt.

10 My wife was a heavy smoker for many
11 years. She stopped about a year or two after
12 we were married, which was 10 years ago, and
13 she did so through the American Cancer Society
14 programs. Had a difficult time in -- in so
15 doing, but has remained tobacco free now for
16 about five or six years, seven years, whatever
17 that is.

18 BY MS. ECKELS:

19 Q. Do you know at what age your son started
20 smoking?

21 A. I think about 16.

22 Q. How old is he now?

23 A. 21.

24 Q. Have you participated in any attempts to
25 assist him in quitting before?

1 A. Yes, I have.

2 Q. And could you describe those for me?

3 A. Well, initially they were just short of
4 bodily harm suggestions. Those were ineffective,
5 as they always are. And, therefore, other than
6 discussions of it, was not particularly able
7 to influence that in the early period of it.

8 The -- although we had numerous
9 discussions about the ill effects of the -- of
10 smoking itself, both short-term and long-term, and
11 also how stupid it was, for he is a very cynical
12 consumer of other advertising to be so gulled by the
13 advertising for tobacco products, which he actually
14 relatively easily admitted that he was.

15 Two summers ago, when he was at -- here
16 in Tampa -- or it might have been three summers ago
17 -- we made an attempt at using the nicotine patch,
18 and he was able to stop smoking using that.

19 However, when he returned to school
20 and all of his friends were smoking around him, he
21 resumed his smoking habit, and he's not been at home
22 for a prolonged period of time since then to make
23 another attempt at it.

24 Q. Would it be correct to say, Doctor, that
25 you have done everything you can to make your son

1 aware of the risk factors affiliated with cigarette
2 smoking?

3 A. Yes. That's true.

4 Actually, if I could complete that
5 answer. The -- he is, himself, poignantly aware,
6 from school and from his own reading, of the
7 dangers, the risks and all the problems. He finds
8 that he is just -- he is not physically able to
9 stop.

10 Q. You mentioned to me that your wife
11 stopped smoking through, I think you said, an
12 American Cancer Society program. Did that entail
13 the use of the nicotine patch?

14 A. No, it did not.

15 Q. What did that program encompass?

16 A. I can't remember what they called it,
17 Smoke-Free or Smoke-Enders, or whatever it was.
18 But, fundamentally, if -- let me -- I have to back
19 up a second in order to answer that, but there
20 is a body of knowledge on smoking cessation
21 that was first proposed by a Dr. Prochaska,
22 P-r-o-c-h-a-s-k-a, from Rhode Island that said the
23 message -- the way you help someone stop smoking
24 depends on -- and this applies to other health
25 behaviors as well but in smoking in particular -- is

1 geared -- the message you give them is geared to the
2 stage -- the readiness stage that they are in for
3 stopping.

4 So if you have someone who says, "I
5 love smoking; I love the taste. I don't have any
6 intention or desire to stop," that the message to
7 get them to stop is very different from the one you
8 give someone who says, "I desperately want to stop
9 smoking. I have not been able to."

10 And there's a -- obviously, a spectrum
11 of change in between -- it's called Change Readiness
12 Theory -- on --

13 My wife was in the former category where
14 she loved to smoke cigarettes until we got married.
15 And then, after being with me at hundreds of Lung
16 Cancer meetings around the world and talks, realized
17 that this was pretty stupid of her, to be smoking,
18 and was desperately trying to stop, but had a very
19 difficult time with it.

20 And so the American Cancer Society
21 program is -- that program was focused on people who
22 were in that particular situation, and it turned out
23 that the process of explaining what the side effects
24 and what the urges -- the side effects of stopping
25 would be and what the urges were and how to overcome

1 them -- and I think they tried to use Nicorette
2 gum, which was available at the time. This was
3 before the patches were available. She found
4 that distasteful and a little bit unseemly and,
5 therefore, struggled through it, and those of us
6 around her struggled through it for several weeks
7 until she was able to stop. But none of us would
8 have described it as a pleasant process.

9 Q. As your son was growing up, during his
10 childhood years, was there anyone in the house --
11 in his household who was a smoker?

12 MR. SCHLESINGER: You see, that's the
13 problem with -- with invading one's privacy,
14 and that's why I raised that objection, but
15 it's entirely up to you, Doctor.

16 A. Yes. I was divorced when he was -- hmm,
17 seven or eight, somewhere in that -- it could have
18 been a little bit -- eight or nine -- and then
19 remarried when he was twelve or thirteen, somewhere
20 in that ballpark. And so for the first -- for the
21 period of time that I was dating my wife and the
22 first year or two we were married, he saw her smoke,
23 and was merciless, along with his sister, in
24 denouncing her for doing so. They used to break
25 her cigarettes. They used to pour things in her

1 cigarette packs. I mean, they would do everything
2 they could to get her to stop smoking.

3 Q. Did his natural mother smoke?

4 A. No.

5 Q. Has your daughter ever smoked?

6 A. No, not to my knowledge. And she does
7 spend prolonged periods with us here in Tampa, and
8 -- and I've never seen her smoke or be so inclined.

9 Q. Doctor, you have -- together, I think, we
10 have come up with an outline, if you will, or a list
11 of the various areas in which you consider yourself
12 to be an expert, and you have told me which of those
13 areas you intend to offer expert opinion testimony.
14 Correct?

15 A. That's correct.

16 Q. Have we come up with a fairly -- a
17 comprehensive list, to the best of your knowledge,
18 of the various areas in which you intend to testify
19 about?

20 A. I believe we have, yes.

21 Q. Okay. I would like, at this point,
22 Doctor, to start going back over that list and to
23 determine from you exactly what your opinions are in
24 those various areas. And I preface this just so
25 you'll sort of know where I'm going with the

1 questions today.

2 A. Sure. No problem.

3 Q. I think -- I frequently find that
4 helpful.

5 The first area of testimony that you
6 mentioned to me was that you felt that you were an
7 expert in, and would be prepared to give expert
8 testimony regarding, the diagnosis of a cancer
9 patient.

10 A. Yes.

11 Q. And I think, given your history, and for
12 purposes of this conversation, let me tell you, I'm
13 always going to be referring to lung cancer.

14 A. Okay.

15 Q. If I deviate from lung cancer, I will be
16 specific with you and tell you.

17 A. Okay.

18 Q. Can we have that understanding?

19 A. That's fine.

20 MR. SCHLESINGER: Let me tell you this,
21 Counsel. If you're going to confine your
22 interrogation, as far as lung cancer is
23 concerned, it's not our intention to confine
24 his expertise to that particular area of
25 pathology, just so long as you're advised.

1 MS. ECKELS: I appreciate that.

2 BY MS. ECKELS:

3 Q. And, as we go through them, I will ask
4 you, Doctor, if your opinions differ or vary any as
5 it would pertain to other types of cancer other than
6 lung cancer. But as we begin each discussion --

7 A. Okay.

8 Q. -- I will be focusing on lung cancer. Is
9 that okay with you?

10 A. That's fine with me, and I will --
11 whenever I go off of lung cancer to make a point, I
12 will try to make that clear.

13 Q. That would be very helpful. As I said --

14 A. Excuse me.

15 Q. As I believe I said, the first area that
16 we talked about or that you mentioned that you felt
17 you were an expert in and that you would be willing
18 to offer expert opinion testimony was in the area of
19 diagnosis. Can you describe for me, generally,
20 Doctor, what are the methods by which lung cancer is
21 diagnosed in a patient?

22 A. A proportion of patients -- approximately
23 30 percent -- will have a chest x-ray taken for
24 other reasons -- cataract surgery, heart surgery,
25 routine examination, or whatever -- and a nodule or

1 an abnormal shadow on that chest x-ray will be
2 appreciated.

3 The remaining 70 or so percent of people
4 will present with a symptom. Most of those will
5 present with one or another pulmonary symptom,
6 cough, shortness of breath, sputum production,
7 eventually hoarseness or bleeding, hemoptysis --
8 h-e-m-o-p-t-y-s-i-s, as it's called.

9 And then, further on, as the disease
10 spreads, various lumps and various enlarged lymph
11 nodes, back pain, headaches, double vision,
12 confusion, weight loss and just constitutional
13 symptoms of weakness, loss of appetite.

14 Since the disease can go pretty much
15 anywhere, it can present in pretty much any fashion.
16 So that's the general presenting characteristics of
17 it.

18 Q. And what tools, other than chest x-ray,
19 are the tools that you rely upon in making a
20 diagnosis of lung cancer?

21 A. We use -- and I will, for clarity -- as
22 part of the group, the thoracic group that I work
23 with, I will use the term "we" instead of myself
24 alone, and try to distinguish, so I'm not going back
25 and forth about which test I actually do versus

1 which one I use in that, if that's all right with
2 you.

3 Q. I will understand that the "we" means the
4 Thoracic Oncology Group that you practice with at
5 Moffitt.

6 A. Participate in, okay. We use primarily
7 the chest CAT scan, to the degree that it includes
8 the abdominal organs, the liver and adrenal, as
9 well. We use mediastinoscopy -- m-e-d-i-a-s-t-i-n-
10 o-s-c-o-p-y -- and mediastinotomy -- o-t-o-m-y on
11 the end of that.

12 We use exploratory thoracotomy,
13 bronchoscopy. We use MRI on occasion as needed in
14 the chest. We use it for the spine and the brain,
15 and we use routine blood tests. And then, depending
16 -- it's a very complex algorithm, which actually we
17 presented at -- we were asked to present in the
18 educational session at the American Society of
19 Clinical Oncology last year -- about when you branch
20 off to do more sophisticated pulmonary function
21 testing, more sophisticated cardiac testing, in
22 order to assess whether someone can tolerate
23 destruction of some portion of their lung either by
24 surgery or radiation therapy. So those are the --
25 the major tests that we use. I can go down any of

1 those pathways you want, but it's a pretty complex
2 diversion.

3 Q. Do you use bronchial washings at all
4 as a --

5 A. Yes. It's part of bronchoscopy,
6 bronchial washings, bronchial lavage -- oh, I'm
7 sorry -- transbronchial biopsies, any -- I include
8 that under the term of bronchoscopy. We use fine
9 needle aspirations. There's not a technique we
10 don't use in terms of doing that other than
11 PET scanning, which we don't think adds anything
12 in particular.

13 Q. Would you agree with me, Doctor,
14 that lung cancer is a multifactorial process?

15 A. I think, in the broad sense, yes.
16 And by that, I mean that it's not that it is caused
17 by -- individually, by a whole series of different
18 things, so that each of them might be said to cause
19 that individually, but by a summation of multiple
20 factors that lead to an accumulation of genetic
21 changes within the cell that obviously -- that flip
22 it from irritated but nonmalignant to malignant and
23 permanently so.

24 So if that's the context of
25 multifactorial, that's -- I would agree with you.

1 Q. What type of classifications of cancer
2 are there -- or can be reached as a result of using
3 these various diagnostic tools?

4 A. We do two things, which I would explain
5 to a layman or to a patient, as we need to
6 understand what it is and where it is. And so,
7 using those tools, we determine exactly which
8 histology -- what it looks like under the
9 microscope, which variation of lung cancer it is.

10 Now, I would say up until the last
11 several years, that has entailed a great deal of our
12 time and with a great deal of splitting of
13 differences between the various cell types of lung
14 cancer, between small cell and the ones that are
15 described as non-small cells.

16 But, I think as therapy has improved over
17 the last five to six years, there's really
18 increasingly little difference between them in
19 outcome. But we like to know, because we treat them
20 a little bit differently, what they are under the
21 microscope.

22 Secondly, it's where it is, and that's a
23 process called "staging." And, again, all of those
24 procedures are used to determine where the cancer
25 may have spread. We use it to determine, for

1 example, the likelihood that it has spread elsewhere
2 in the body. So that if we find a very small cancer
3 and no evidence of spread to lymph nodes, we presume
4 that the likelihood of spread elsewhere is low, in
5 the 20 to 25 percent range.

6 The second the first lymph node shows up,
7 it's 60 percent chance of having spread. And the
8 second the next set of lymph nodes are involved,
9 it's 90 percent, so we -- that's the process called
10 "staging." And, again, I can go off into any level
11 of detail on that and have published extensively in
12 that area.

13 Q. The first thing that you told me that
14 is determined as a result -- is the results you get
15 from the various diagnostic tools is the histology.

16 A. That's correct.

17 Q. And that tells you the various cell
18 types. Correct?

19 A. That's correct.

20 Q. And you mentioned small cell and
21 non-small cell. Correct?

22 A. That's correct.

23 Q. What types of cells are included in the
24 non-small cell category?

25 A. Everything but small cell. That

1 includes --

2 Q. Okay. And, generally, in lung cancer,
3 what would that include?

4 A. That includes, commonly, squamous
5 cancers, adenocarcinomas, large cell carcinomas,
6 bronchioalveolar -- b-r-o-n-c-h-o-a-l-v-e-o-l-a-r--
7 carcinomas, and then a whole series of very uncommon
8 little ones, like clear cell carcinomas and spindle
9 -- there -- there are just very rare variations on
10 that.

11 And then a sizable component of mixed
12 ones, where there are mixtures of the various types
13 that are present.

14 Q. Are there some of these cell types,
15 Doctor, which are more statistically associated with
16 cigarette smoking than others?

17 A. It's important to make a -- to be sure
18 which end of this you're coming with. Every one of
19 those cell types is associated with cigarette
20 smoking.

21 On the other hand, if you have
22 someone who is a total nonsmoker, not exposed to
23 environmental smoke at all, who happens to be one of
24 the rare birds that develops a lung cancer without
25 smoking exposure, and they are present, then they

1 tend to have adenocarcinomas and they tend to have
2 bronchioalveolar carcinomas in particular, so that's
3 it.

4 So all of them are associated with it.
5 But if you come in the other direction of a true
6 nonsmoker, nonexposed person, they will tend to have
7 adenocarcinomas.

8 Q. Okay. I've got some followup questions
9 for you, but I believe we're about to run out of
10 time on the video tape.

11 MS. ECKELS: Is that correct?

12 THE VIDEOGRAPHER: Yes.

13 MS. ECKELS: Do we need to stop?

14 THE VIDEOGRAPHER: Yes. The time is
15 12:13. This is the end of the first tape of
16 the deposition of Dr. Ruckdeschel.

17 MR. SCHLESINGER: This may be a good time
18 to break. So why don't we take a break now and
19 come back in a half hour. That'll be about --
20 let's see -- that's not right, that --

21 MS. ECKELS: I've got approximately 12:15
22 on my watch.

23 MR. SCHLESINGER: 12:15.

24 THE WITNESS: 12:15. Quarter to one is
25 fine with us.

1 MR. SCHLESINGER: Well, good. Let's come
2 back at a quarter to one. That's super.

3 MS. ECKELS: Quarter to one.

4 (There was a recess from 12:15 p.m. until
5 1:16 p.m.)

6 THE VIDEOGRAPHER: It's 1:16. This
7 is the second tape of the deposition of
8 Dr. Ruckdeschel. We're on the record.

9 BY MS. ECKELS:

10 Q. Doctor, we've just returned from a
11 lunch break. And prior to that break, we had begun
12 discussing the general topic of diagnosis and what
13 your opinions are in that area. Do you recall that
14 testimony?

15 A. Yes, I do.

16 Q. Okay. I believe you had outlined for me
17 the various diagnostic tools that you and your group
18 typically use in diagnosing lung cancer, as well as
19 -- you told me about some of the typical symptoms.
20 And, as I recall -- correct me if I'm wrong -- you
21 had just told me that the two primary things -- or
22 determinations that are made as a result of the
23 findings from the various diagnostic tools is, one,
24 the histology of the cancer; and, two, the staging
25 of the cancer. Is that correct?

1 A. That's correct.

2 Q. Okay. I'm trying to get back to where we
3 left off right before lunch.

4 A. There was a third piece of that that is,
5 if the patient is an operative candidate or a
6 potential operative candidate or a candidate for
7 aggressive radiation, that there's also the subset
8 of diagnostic information as to whether or not they
9 will tolerate that from a cardiopulmonary point of
10 view, but that's a subset of staging.

11 Q. I'm not sure I completely understood you.
12 Let me see --

13 A. Okay.

14 Q. Are you talking about whether or not they
15 -- a surgical evaluation?

16 A. If I'm going to operate or have someone
17 operated on, the first question, which is the
18 staging question, is: Is the extent of that tumor
19 such that the surgeon could technically remove it?

20 The second question, which is quite
21 distinct and is often confused, both in lay and
22 medical circles, is: Are they operable? Will
23 they survive whatever it is we propose to do?

24 If your pulmonary function or your
25 cardiac function is so bad that removal of half or

1 one lung leaves you with insufficient lung to
2 breathe, we have not done anything useful, even
3 though we could successfully remove the lung.
4 So that's why I said it's a subset. It's
5 the resectability/operability spectrum.

6 Q. Thank you. I understand more clearly
7 now.

8 One of the first determinations that you
9 told me that a physician is able to make after
10 receiving all of the results of diagnostic tests is
11 the histology of the cancer, and we had begun to
12 discuss the various cell types. Do you remember
13 that?

14 A. Um-hum. Yes, I do.

15 Q. And I understand your testimony that you
16 believe that cigarette smoking, to some extent, is
17 affiliated or associated with all cell types. Is
18 that correct?

19 A. It --

20 MR. SCHLESINGER: Well, Counsel, he
21 didn't quite express it in that terminology,
22 "to some extent." If you ask him the question,
23 I have no problem with it. But if you attempt
24 to interpret what he has to say, I don't think
25 it's reflective of what he said.

1 BY MS. ECKELS:

2 Q. I'm not at all trying to put words in
3 your mouth, Doctor.

4 A. Sure.

5 Q. What was your opinion or testimony right
6 before lunch, if you could rephrase it again for
7 me --

8 A. Yeah.

9 Q. -- regarding the association between lung
10 cancer and the various cell types?

11 A. Smoking causes all the various types,
12 but in those uncommon-to-rare instances when you
13 have someone who doesn't smoke, ever, and who hasn't
14 had significant environmental exposure, that if you
15 see a cancer in those folks, which you will on
16 occasion, that that is more likely to be an
17 adenocarcinoma or a bronchioalveolar carcinoma, but
18 that smoking itself causes the whole array of them.

19 And if you took 100 adenocarcinomas,
20 90 percent of those are going to be due to smoking,
21 and the small proportion of those adenocarcinomas
22 will be those that arose in nonsmokers.

23 Q. Have you ever treated a lung cancer
24 patient who was a nonsmoker?

25 A. Yes, I have.

1 Q. Do you keep any records or statistics at
2 Moffitt regarding what percentage of lung cancer
3 patients are treated there who are not smokers?

4 A. I don't know that we keep that as a
5 separate and distinct item. I -- I think it's in
6 the tumor registry material. I believe it's -- in
7 my own experience, it's well under 10 percent. And,
8 again, there's an important distinction here. An
9 individual may not have smoked themselves, but if
10 they have been in a workplace where they've had
11 significant constant daily exposure to cigarette
12 smoke over a multi-year period, there are various
13 ways to calculate their exposure.

14 In addition -- and what may be
15 particularly important, as it is for other cancers
16 -- is a child who is exposed to 20 years or more of
17 his parents smoking heavily in whatever trailer or
18 house they happen to live in.

19 So if -- you know, there's this issue of
20 how you categorize a nonsmoker, and I would -- and
21 because they -- many people now are so embarrassed
22 by their smoking history, that when we ask someone
23 just -- in fact, we actually, on our intake form,
24 have to ask people, "Are you a smoker?" And I would
25 say half of them say "no." But when you ask the

1 next question, which, "Were you a smoker," they say
2 "Yes." And then you say, "When did you stop?"
3 "Last week," when their diagnosis was made.

4 So we do have that information. I'm not
5 sure that we've ever pulled that together, but I
6 would say, you know, from my experience in this,
7 that it's a small percentage.

8 Q. Would you agree, Doctor, that
9 adenocarcinoma is the cell type that has the
10 smallest statistical relationship to cigarette
11 smoking?

12 A. No.

13 Q. What cell type would fall in that
14 category?

15 A. As I said, the -- smoking causes all of
16 them.

17 Q. I understand that.

18 A. Okay.

19 Q. I understand your testimony in that
20 regard.

21 MR. SCHLESINGER: Well, let him finish
22 it. Let him finish his answer, Counselor.
23 Please don't cut him off.

24 A. The -- I would come at it from the other
25 direction, if you'll permit me in here.

1 So if I -- if I just take the whole world
2 of lung cancers, starting where you started me,
3 they're all associated, and they're all associated
4 to virtually the same degree. It's when I come in
5 the other direction of cancers that arise in
6 nonsmokers, that's where I see a preponderance of
7 adenos and bronchioalveolars, but I -- we still see
8 other types there as well. They're just -- those
9 are even more rare.

10 Q. Is -- and bear with me on my
11 pronunciation; it's not going to be quite as clear
12 as yours. The bronchioalveolar --

13 A. Bronchioalveolar.

14 Q. -- bronchioalveolar -- is that a subtype
15 of adenocarcinoma?

16 A. Yes. I'm sorry. It is considered such
17 by most investigators. There are some who would
18 claim that it's a distinct form of lung cancer, but
19 it's a semantic issue.

20 Q. Okay. Do you personally believe that it
21 is a subtype of adenocarcinoma?

22 A. Yes. And I will -- at any time in
23 here, I would digress to show you, sort of in a
24 diagrammatic fashion, why there are not clear
25 boundaries between the various areas that we see,

1 but I'll wait for the appropriate moment on that.
2 So you don't say, "Adenocarcinoma, this subset is
3 totally distinct." Bronchioalveolars look at --
4 look like an adenocarcinoma on many occasions. We
5 frequently see an adenocarcinoma that we say has
6 some features of it; and, as I indicated earlier,
7 many tumors are mixed right from the beginning.

8 Q. And do you rely, typically, on a
9 pathologist to make that determination as to cell
10 type?

11 A. Yes.

12 Q. And what materials do they need in order
13 to make an accurate assessment of cell type?

14 A. Any number of materials; anything from
15 cytologic specimens, from bronchial washings, fine
16 needle aspirations, which are cytologic. Cytologic
17 means we have loose cells. Histologic means we have
18 a piece of tissue, and those are from biopsy
19 specimens or operative specimens, whichever; any of
20 the above.

21 Q. In your opinion, are the pathological
22 findings based on histology more reliable than those
23 based on cytology?

24 A. The vast majority of the time, yes.

25 Q. You mentioned that the second

1 determination that is frequently made after all
2 diagnostic results are in is staging. Could you
3 define and explain what staging is?

4 A. Staging is the -- as I said in lay terms
5 before -- is "Where is it" and "What are the chances
6 that it has spread from the original site of
7 origin?"

8 So we -- it is based on three components:
9 The size and extent of the tumor, the number and
10 extent of lymph node involvements, and the presence
11 or absence of metastases. And it's "T" for tumor,
12 "N" for nodes, "M" for metastases, the TNM system.
13 And there's a grid that comes from this. The --
14 and if you take each one of them independently, they
15 have a separate piece of prognostic information.
16 And then when you cross them in the grids, sometimes
17 you get unexpected findings in there.

18 So, for example, the smaller the tumor,
19 in general, the better you're going to do. The less
20 lymph node involvement, the better you will do. If
21 you have no metastases visible, you'll do better
22 than if you have visible metastases. All those are
23 relatively obvious.

24 But a small -- very small cancer that has
25 one lymph node positive is biologically much worse

1 than a huge cancer that either has no lymph nodes
2 positive or has two or three lymph nodes positive,
3 because it speaks to how fast that individual cancer
4 is growing.

5 So there's a lot of -- this accumulation
6 of events, this summation of all the things that
7 happened to the individual cell, comes up with
8 different answers for how these behave, and they can
9 be very variable.

10 Now, if you stand back from it and you do
11 thousands of people, there are relentless patterns
12 that we see. But for the individual, they can be
13 quite distinct.

14 Q. And the determination of TNM has a great
15 bearing on the treatment which is --

16 A. Absolutely.

17 Q. -- which is going to be prescribed for a
18 particular patient. Correct?

19 A. Absolutely.

20 Q. Why is it important to know where the
21 cancer is?

22 A. Well, the first issue that I defined
23 for you of resectability -- we would always like to
24 resect a cancer. Everything else we've ever used,
25 whether it's radiation, chemotherapy, immune

1 therapy, whatever, there is a propensity for the
2 cancer cells to become resistant as part of the
3 changes that they continue to accumulate after they
4 become malignant. But a cancer has never been known
5 to become resistant to being in a pan across the
6 room sitting in formula.

7 So if we get it out of the body, we're
8 much happier about that. And so, we pay a lot of
9 attention to staging because that tells us whether
10 or not the patient is operable.

11 Now, for us, in a referral center, we are
12 particularly and peculiarly interested in it
13 because, "A," we need it for clinical research to
14 sort the patients outright. But, "B," we see all
15 the patients who are in the gray zone. And so
16 knowing exactly what their extent of disease is and
17 whether they can survive the operation down to the
18 minutest detail of that is important because we get
19 people who are normally -- I mean, we see two or
20 three people a week who are turned down for surgery
21 elsewhere, who we subsequently go on to operate on
22 because we have a more sophisticated understanding
23 of how to make them operable and what is tolerable
24 for surgery. So that's why the staging is
25 important.

1 Q. Within your field -- within the field of
2 oncology, is staging universal from hospital to
3 hospital or facility to facility, or is there some
4 variation in how you would determine a staging
5 versus an oncologist in another state or another
6 facility?

7 A. The staging systems are internationally
8 agreed upon and nationally agreed upon. We have
9 boards and councils, et cetera, that we all accept
10 the staging system. There remain nuances of
11 interpretation of location that people still argue
12 about as the systems undergo change. We and others
13 have argued that the system needs to be changed
14 either by expanding certain categories or
15 contracting others or redefining in certain ways;
16 but, fundamentally, we all agree to the same ones.

17 Where you run into problems is that
18 people who are more -- who are less well-trained,
19 who have less current experience, will frequently
20 wind up using older staging systems, and they
21 confuse the daylights out of everyone when they
22 report or discuss data in those terms. But the
23 staging systems themselves are universal, if you
24 will.

25 Q. You mentioned just a moment ago that

1 there may be some patients that present at one
2 hospital and that they're not -- they're considered
3 inoperable, but yet through the unique and more
4 detailed regime that they're put through at Moffitt,
5 you may learn that they, in fact, are operable.
6 Correct?

7 A. That's correct.

8 Q. Would you agree with me that, as compared
9 to most hospitals, a cancer research center, such as
10 Moffitt, is going to do a more detailed evaluation
11 of a cancer patient than the average hospital?

12 A. It really is dependent on the individual
13 case and specifics, but in these kinds of -- we all
14 see a bell-shaped curve of patients. We tend to see
15 the end of the spectrum where there are complexities
16 and concerns about operability, resectability,
17 curability, tolerability of therapy, et cetera,
18 because that's the nature of a referral center. I
19 mean, if it's a simple, straightforward cancer, a
20 lot of places just take care of it themselves,
21 where it's -- whether it's lung or anything else.

22 So we tend to see a skewed pattern of
23 that, and so we develop more expertise at that, and
24 it becomes a self-fulfilling issue. So, yes, we do.
25 It doesn't mean that the workup -- the initial part

1 of the workup is any different at ABC General versus
2 a cancer center.

3 But when you get to the questionable
4 cases, they could do that workup there, but they're
5 just not as familiar with it and they don't do it
6 every day the way we do. And that holds, I think,
7 for all, all cancer centers.

8 Q. When a patient is referred to Moffitt,
9 do you accept the workup that was done at -- by the
10 original referring facility, or do you basically
11 start over from square one by taking a history and
12 exam and starting the workup, to use your phrase,
13 over again?

14 A. Yes. We take a complete history. We ask
15 them -- and do a complete physical examination. We
16 ask them to bring all of the records that they have
17 from their previous institution.

18 We then review those records -- actually,
19 even before we see the patient -- for timeliness and
20 completeness.

21 We actually, as part of our daily
22 routine, will present the x-rays, any of the
23 historical material, and the pathology slides at our
24 conference, and look at them together as a group,
25 and decide, "Is this set of x-rays timely enough?"

1 Have they been done within a time frame that's
2 appropriate, or is there likely to be a change?
3 Are there others that need to be done, or are these
4 fine? Are the films that have come in fine? Is
5 the quality of the film good?"

6 Same with the pathology. If the
7 pathologist who is present says, "I'm looking at
8 this material and I can make a clear diagnosis from
9 it. I agree with their diagnosis." Or even if he
10 disagrees, but he's clear about it, then we say,
11 "We're done. We have enough material."

12 If he says, "This doesn't make sense,"
13 and I'm looking at something that they're calling
14 this, and I'm not sure it's that and we need to do
15 further tests, then we do further tests, and I --
16 two to five percent of the time, we have to go back
17 and obtain new tissue because it was not adequate
18 for diagnosis.

19 So we review everything when it comes
20 back each time, and then we -- it depends on the
21 quality of it. Oftentimes, it's very good and we
22 just use their material.

23 Q. For purposes of diagnosis, and even for
24 future treatment, how important is it to know the
25 primary site of the cancer?

1 A. It's always critical to know that.

2 Q. Why is that?

3 A. In general, we will treat them
4 differently, depending on where the primary site is.
5 That doesn't mean they'll -- they'll do any better
6 or any worse, but we generally have developed
7 treatments that vary somewhat by the site of origin
8 of a cancer. Some of that's historical; some of it
9 makes good medical sense. Some of it's based on
10 solid research; some on intuition.

11 So knowing where we think a cancer came
12 from is important to us. The -- and the cancers --
13 one of the other major elements of managing a
14 patient is understanding the catastrophes that are
15 likely to befall you in the future care of that
16 patient.

17 So we know that certain cancers -- I'll
18 pick colon cancer or prostate cancer -- tend to
19 spread to the lung or bone, but tend not to spread
20 to brain or other places; whereas, lung cancer will
21 go to brain or spine. And so we're uniquely
22 sensitized to look for it in those places.

23 So it is -- that's how we would do that,
24 or a colon cancer. If I know someone has that, then
25 every time they get a little bloated, I don't think

1 they just had too much to eat; I'm worried about
2 bowel obstruction. Whereas, with lung cancer, I'm
3 not worried about bowel obstruction. So it's that
4 kind of picture to understand the primary.

5 Q. Being that the original or primary site
6 of the cancer is important, what steps do you take
7 -- or your group at Moffitt -- to determine the
8 primary site of the cancer when you see a new
9 patient?

10 A. The -- we take all the steps that I've
11 previously mentioned in terms of reviewing all the
12 materials.

13 I would say that 99.9 percent of the time
14 a cancer is either obviously a cancer that arose in
15 the lung, and it has all of those characteristics --
16 and I can enunciate them in a second if you wish --
17 or one percent of the time or less we're concerned.
18 We say, "Gee, this clinical pattern doesn't fit.
19 Something isn't -- doesn't gel here." There's a --
20 either the shape of the tumor or where it has spread
21 to or where it hasn't spread to, et cetera, will
22 click for us.

23 As an example, we may see a person
24 who presents with coughing up blood, and we would
25 normally say, "Okay. Well, that's a pretty standard

1 sign of lung cancer," and we'd start looking.
2 And we'd take a biopsy of that, and we would see
3 something in the airway and some small nodules in
4 the chest, but we wouldn't see a big cancer in the
5 lung.

6 Now, instantaneously, we would say, "This
7 sounds like kidney cancer," which is one of the rare
8 ones that can metastasize to the airway and to the
9 lungs, and so we would expand our search to look for
10 the kidneys in that -- look at the kidneys, and
11 overwhelmingly we find it in those cases.

12 So we'd track them down, you know, in
13 that fashion, but it is -- it is very uncommon.
14 There are some very clear things about the location,
15 the shape, the tendency to spread into the tissues
16 around them -- we call them spiculations in the
17 tissue -- the spread to the local lymph nodes, the
18 obstruction of airways. I mean, all those things,
19 the order in which things happen, they are so
20 incredibly classical for lung cancer that it is
21 rarely a diagnosis in doubt.

22 Q. Is it common, Doctor, for a patient to
23 present themselves with a diagnosis of lung cancer
24 and then to later determine that the cancer was
25 metastasized from another organ?

1 A. I would say that that -- if we see that
2 five or six times a year at the Moffitt, as a whole,
3 for all of our cancers -- let me keep it to our lung
4 area. We see about 500 new patients a year in the
5 thoracic area. And if we see two or three patients
6 in whom that is the issue, that's a big year. I
7 mean, normally it's one -- and, in fact, normally
8 it's never resolved where it came from. You're not
9 quite -- you're just -- even on autopsy, you're
10 still not sure, and that's because people can
11 develop multiple cancers, and so you're not quite
12 sure whether they had an incidental kidney cancer
13 and a lung cancer or one spread to the other, but --
14 but that is so rare as -- it is extremely uncommon
15 that that's a clinical problem in dealing with
16 people. Usually, it is a sledgehammer on the
17 forehead to let you know that this is lung cancer.
18 It's a very obvious diagnosis.

19 Q. Okay. I'm just a little confused now
20 between the rare and the common. Did you just say
21 that it is common to never know exactly where the
22 cancer came from?

23 MR. SCHLESINGER: No. He didn't say
24 that, Counselor.

25 Q. Did I misunderstand you?

1 A. Yes.

2 Q. Please state it again.

3 MR. SCHLESINGER: Did you misconstrue
4 that?

5 Q. Apparently, I misunderstood you, Doctor.

6 MR. SCHLESINGER: Yeah.

7 Q. Would you -- regarding the incidence
8 where you do know the exact primary site and
9 origin of the cancer versus those percentage of the
10 incidents where you don't ever know where the cancer
11 originated, how does that play out?

12 A. Okay. There are -- now, in the area of
13 lung cancer, again, separating this out from cancer
14 in general, okay? -- when we're dealing with bowel
15 and other sites, there are frequently cancers we're
16 not quite sure where they came from. Okay?

17 Q. Okay.

18 A. When we're dealing with metastases to the
19 lung or to lymph nodes or to bone, we occasionally
20 -- two to three or four percent of the time -- don't
21 know where they came from and may never find it,
22 even at autopsy.

23 With lung cancer, on the other hand,
24 99.9 percent of the time we're absolutely sure it
25 came from the lung. Very rarely -- extremely

1 rarely, we have difficulty trying to sort out
2 whether what we're seeing in the lung is something
3 that arose in the lung or came from somewhere else.

4 Q. Would you think that that is true for all
5 facilities, or is that perhaps uniquely true for
6 Moffitt because of the type of referral facility
7 that Moffitt is?

8 A. I think that the percentages may change
9 to -- from a tenth of a percent to one or two
10 percent elsewhere, and there's a big difference
11 between what you see and you think the first day you
12 see a patient and what the workup ultimately shows.

13 So, yes, the first day you look and you
14 say, "Gee, I'm not sure where this is." That
15 doesn't mean that that's your opinion forever.

16 So I think in the vast majority of
17 institutions where you have competent diagnoses,
18 good internists, good surgeons, good pathologists,
19 good radiologists, 98 percent of the time it's very
20 clear from day one.

21 Q. Do you know what the data statistically
22 is on lung cancer, of original primary site lung
23 cancer versus metastases to the lung?

24 A. Yes.

25 Q. What -- can you tell me what that is?

1 A. Well, again, it depends on -- on several
2 things. If you -- I know -- I can relate to you in
3 gory detail all the survival data in lung cancer,
4 and that's -- we can do that at any time, but -- and
5 that's stage-related. It used to be more
6 histology-related, but that's hardly -- it's really
7 almost not an issue anymore. It's mostly
8 stage-related.

9 The -- cancers that come from elsewhere;
10 it depends on what that cancer is and what its
11 growth rate is, so --

12 Q. Let me stop you right there. I'm sorry.
13 When you say "what that cancer is," are you
14 referring to cell type?

15 A. Yes.

16 Q. Okay. Thank you.

17 MR. SCHLESINGER: Counsel, don't do this.
18 Please don't interrupt the witness when he's in
19 the midst of an answer.

20 MS. ECKELS: I'm just clarifying the
21 testimony.

22 MR. SCHLESINGER: You can clarify it when
23 he has finished his answer.

24 A. The cancers that arise elsewhere and
25 spread to the lung, that are primary elsewhere, have

1 a period of what we call disease-free interval that
2 impacts on them and is related to their growth rate.

3 So, for example, if I resected a breast
4 or a colon cancer from you or someone you knew, and
5 I did that six months ago, and you present to my
6 office today with spread to the lung, then I say,
7 "A," I knew that those cells had to have been there
8 six months ago, and that that's a pretty rapidly
9 growing cancer, because it's gone from nothing that
10 I can see to something that I can see, which is
11 going from a million or two to a couple of gazillion
12 cells in a relatively short period of time. It's
13 doubled quickly.

14 And so I say, "Gee, that is a very bad
15 prognostic sign." In that particular colon cancer,
16 that patient is going to die very quickly unless
17 we're very lucky with chemotherapy.

18 Other colon cancers that sit for three
19 and four years before it shows up in the lungs --
20 again, I say, "Yes. Those cells were there in the
21 lungs at the time of the surgery, even though we
22 couldn't see them. But it's taken them three or
23 four years to grow up to a point where we can see
24 them," and that then determines what we do for
25 therapy. When they're very slow-growing like that,

1 we'll go in and try to resect them from the lung
2 if they're within a reasonable number.

3 If there's a whole slew of them, or
4 if they've shown up within the first year after the
5 previous surgery, we make the presumption that this
6 is a biologically bad cancer. So, again, there's
7 not a fixed answer to "one is worse; one is better."

8 So, in point of fact, you can have
9 a metastatic cancer from elsewhere that has a
10 wonderful prognosis because you can cure them
11 because of that issue of very slow growth. You can
12 go in and resect them. It's uncommon, but you can
13 do that. And the lung cancers can run their normal
14 spectrum. They're a -- they're a different
15 kettle of fish and it's an -- something that's
16 individualized really with each patient and their
17 cancer.

18 Q. And perhaps I didn't word my question
19 adequately, Doctor. What I was asking you, and what
20 I'm going to try to ask you now is: From the
21 overall number of lung cancer cases in the U.S., are
22 you familiar with any statistical data or studies
23 which breaks down the percentage of those cases
24 which are primary lung cancer cases versus those
25 which are metastatic cancer to the lungs?

1 A. There is no -- it's not a way we would
2 normally -- I mean, it's like talking about the menu
3 in a restaurant and the things you can buy on a car.
4 I mean, they're usually not listed in the same
5 context. So that would have to be experiential,
6 just from what I've seen at various institutions,
7 and I think I gave you those figures already, but I
8 don't think anybody collects the data in that
9 fashion.

10 Q. Okay. And the figure you're referring to
11 is the 99.9 percent figure you gave me earlier?
12 Is that what you're referring to?

13 A. Correct. Yes.

14 Q. Are there cancers from certain organ
15 systems that are more likely to metastasize to the
16 lung than others?

17 A. Yes.

18 Q. What would those be?

19 A. There are two things that determine that,
20 sort of where the cancer arises and what -- if you
21 will, what we call capillary filters. Can I sketch
22 something here for you, or is that going to mess up
23 the videotaping? It's a simple --

24 Q. I'll -- I have no objection. I'll let
25 your counsel decide whether he has a problem with

1 it.

2 A. Is that all right?

3 MR. SCHLESINGER: I'm not his counsel.

4 A. If I have some --

5 MR. SCHLESINGER: I'm just a lawyer here.

6 A. If I have a cancer that's down in the
7 bowel, the usual source of that is the -- is it gets
8 into the bloodstream and it heads back to the liver,
9 at that point the vein breaks down into capillaries,
10 and then comes back together as a vein; and then it
11 gets to the heart, and then it is shipped to the
12 lungs where it, again, breaks down into very, very
13 tiny blood vessels. Again, these are all veins
14 coming this way with -- on the other side, those
15 capillaries re-collect into arteries, and then the
16 blood is pumped through the body.

17 So if a cancer goes to the liver first,
18 which bowel cancers tend to do so, because their
19 blood drainage goes that way, then they tend to
20 spread to the liver, because that's the first
21 filter that they come upon.

22 Cancers that -- that don't do that, that
23 tend to arise in bone or in soft tissue and other
24 places, the first thing they tend to see, because
25 their blood supply comes in here past the liver, is

1 the first filter they see is the lungs, and so the
2 tendency is for them to spread to the lungs as the
3 first site.

4 So the first thing is this issue of
5 the first filter, and then there are several issues
6 related to what we call tissue specificity. It
7 seems clear; it's not fully defined yet at the basic
8 science level, but it is well-defined clinically,
9 and that's what clinical experience is -- that
10 certain cancers tend to grow better in certain
11 organs.

12 For example, prostate cancer and
13 breast cancer, almost invariably, spread to bone.

14 What it is about the bone that --
15 the environment of bone that a hormonally sensitive
16 tumor like that is -- that makes it spread there is
17 less clear. There are others, perhaps, who know
18 that better than I do. But there's that clear
19 tissue specificity for bone.

20 So if I see a man and he's got bone pain
21 -- he's aching. Somebody shows me a bone scan with
22 30 different sites lit up, prostate cancer comes to
23 my mind instantly. That's the first thing.

24 If I see a woman with that bone scan,
25 it's breast cancer that I come to.

1 And there are, indeed, some cancers that
2 seem to have a predilection for spreading to lung as
3 the first site to do that. Head and neck cancers --
4 for example, larynx, throat -- tend to spread to
5 lung as the first site.

6 Sarcomas seem to have a predilection
7 for spreading to lung and staying in that particular
8 organ.

9 Q. I'm sorry. Are you finished?

10 A. Yes.

11 Q. I wasn't writing as quickly as you were
12 speaking. You said, "Head and neck had a strong
13 likelihood of" --

14 A. And sarcoma.

15 Q. And sarcomas. And did you say -- was
16 there another one in the middle? Was it larynx?

17 A. Larynx and throat are all head and neck
18 cancers.

19 Q. Okay. Was there -- did I miss one other
20 than head, neck and the sarcoma? Okay.

21 A. No. I don't -- this is --

22 MR. SCHLESINGER: You can briefly hold it
23 up, just so the -- can you get that?

24 THE VIDEOGRAPHER: I'm getting it. Just
25 a moment.

1 MS. ECKELS: If you feel more comfortable
2 attaching it as an exhibit, that's fine.

3 MR. SCHLESINGER: It's not necessary.

4 THE VIDEOGRAPHER: Okay.

5 THE WITNESS: Okay?

6 THE VIDEOGRAPHER: Thank you.

7 THE WITNESS: It's the teacher in me.
8 I'm used to drawing diagrams of how things
9 work, so --

10 MS. ECKELS: And that's very helpful.
11 I appreciate it.

12 BY MS. ECKELS:

13 Q. Would it be correct to say, Doctor, that
14 the likelihood, then, of cancer from one organ
15 system metastasizing to the lung -- one factor in
16 that process is the transportation system of the
17 blood, the way in which it flows?

18 A. That's correct.

19 Q. The second factor is the various organs
20 that it -- that transportation system interacts
21 with; and, as you use the phrase, filters?

22 A. Yes.

23 Q. Okay.

24 A. There's also an issue of how much blood
25 gets to each organ. Some organs have a very high

1 blood flow; brain, kidneys, for example. Others
2 have a much slower blood flow, so there's
3 statistical chances based on how much blood goes to
4 a place as to whether something that's blood-borne
5 will get there or not.

6 Q. You mentioned that you believe there's a
7 strong likelihood that you will frequently see
8 breast cancer metastasize to the bone.

9 A. That's correct.

10 Q. Have you ever seen breast cancer
11 metastasize to the lung?

12 A. Yes.

13 Q. Have you ever seen bladder cancer
14 metastasize to the lung?

15 A. Yes. Before we go down that, I've seen
16 virtually every cancer metastasize to the lung at
17 one point in its course, okay? So even though that
18 colon cancer has a propensity to go to the liver,
19 where other cancers have a propensity to go to bone
20 or someplace else, they will, with the -- well, I
21 can't say that. Even brain tumors, I've seen one
22 that has spread. That's about as rare a thing as
23 you'll ever see. But virtually every other cancer
24 can spread to lung.

25 But the pattern of that spread and what

1 it looks like clinically and the obvious history of
2 either an active cancer elsewhere or history of a
3 previously resected cancer in the area sets it off
4 -- makes it relatively obvious whether we're dealing
5 with metastatic disease or not. Is it always that
6 way? No. I mean, there's always a few oddballs
7 that you can't figure out, but the vast majority of
8 the time.

9 Q. You just mentioned time factor --

10 A. Yes.

11 Q. -- between a prior cancer being resected
12 and a later diagnosis of lung cancer.

13 A. Yes.

14 Q. Is there an accepted time frame within
15 which you would expect a cancer that has been
16 resected or treated in another organ system to
17 metastasize to the lung?

18 A. Yes. It's highly variable, however, and
19 it's -- and it's related to, you know, this process
20 of going from one cell to two cells to four cells
21 to eight cells to one billion to two billion to four
22 billion. It's the interval of time in between there
23 that's important. That's very variable between
24 cancers. It tends to coalesce into a little
25 narrower package of times for various types of

1 cancer, but there's still broad diversity among
2 cancers, even within the same cell type, in what's
3 called doubling time, the time one goes to two, two
4 to four, et cetera, and how that process works.

5 So there are some cancers, primarily
6 lung among them, leukemias, relatively rapidly
7 growing cancers -- that if there's no evidence of it
8 after three, four, five years -- the chances that it
9 had spread and is going to come back are extremely
10 low, and the risk is more of a second cancer
11 arising.

12 On the other hand, breast cancer, colon
13 cancer, some of the slower-growing cancers --
14 clinical trials in breast cancer often have to last
15 10 or 20 years of followup because you -- I've had
16 women 27 years after their breast was removed show
17 up with bone metastases from what was a dormant,
18 very, very slowly growing breast cancer, which has
19 now, obviously, undergone another mutation and
20 starting to grow more rapidly. So we just know that
21 clinically. We know the ones that are capable of
22 going very slow.

23 So a breast cancer patient, I say, "Yep,
24 things look great. We're five years out. We're not
25 totally out of the woods yet." Whereas, with a lung

1 cancer patient or leukemic, I'd say, "We're out of
2 the woods."

3 Q. In your experience, Doctor, when a
4 lung cancer patient presents themselves, in most
5 facilities -- and I don't want to confine this
6 just to Moffitt because of your unique research
7 evaluation -- and --

8 A. Excuse me. That's a clinical evaluation,
9 not a research evaluation we do.

10 Q. I'm sorry. Thank you for the correction.

11 A. Yeah.

12 Q. In your experience, in dealing with
13 medical facilities, generally, when a lung cancer
14 patient presents themselves and it is determined
15 that the staging is advanced, do most clinicians
16 determine whether or not that cancer was a primary
17 or a metastasis?

18 A. Yes.

19 Q. Does it make a difference in the course
20 of treatment?

21 A. It often does, yes. In fact -- let me
22 clarify that. Virtually all of the time it makes
23 a difference. It makes a difference in what they
24 choose to treat with. It may not make a bit of
25 difference in terms of what the outcome is.

1 Q. How does it affect the treatment?
2 What varies the treatment based on primary versus
3 metastasis?

4 A. If I have a metastasis to the lung
5 that came, for example, from the colon, there are
6 certain drugs that we use for colon cancer that
7 are marginally to modestly effective that have
8 absolutely no benefit whatever in lung cancer,
9 and vice versa.

10 And so if I have a colon cancer that
11 metastasizes to lung and I am either fooled or lazy
12 enough not to do the evaluation, and assume that
13 it's a lung cancer and I give it lung cancer
14 therapy, I have not given them effective treatment
15 for their colon cancer. If I do the opposite, I
16 give them colon cancer therapy; I've not given them
17 active -- or appropriate treatment for their lung
18 cancer, and that's particularly important in areas
19 like breast cancer where we have this one whole
20 option of very, very non-toxic hormonal therapy.

21 So for me to have a mass in the lung and
22 a woman who has had a prior breast cancer and not be
23 very certain about whether that's a metastasis or a
24 primary -- again, that's not usually a problem. But
25 to not be certain about that -- for any physician

1 not to be certain about that, when one whole group
2 -- a quarter of them are going to wind up on
3 hormonal treatment, which is extremely benign and
4 likely to last thoroughly -- you know, a thoroughly
5 good response for many years. I mean, that's --
6 that's not in the patient's best interest, so --

7 Yeah, most people are very, very --
8 first of all, it's obvious clinically; it's so
9 overwhelmingly. And then the ones where it's less
10 obvious, they do that.

11 There are a set of times when you see
12 what is obviously -- and this may be the issue of
13 the carcinoma of unknown primary that people like to
14 talk about and get confused when dealing with this.

15 If I see a cancer that is obviously
16 metastatic to lung, bone, lymph glands, in the neck,
17 wherever else, but it clearly came from someplace --
18 it didn't arise in the lung; I don't see it there.
19 I look in the throat; I don't see it there.

20 I do some very basic tests, and I don't
21 find it.

22 Then there's a whole debate in the
23 literature about whether you should bother to do
24 more tests to figure out or whether it doesn't
25 really matter at that point in time. But those

1 cancers are obviously metastatic on -- and that
2 clinically distinguishing them from lung cancer
3 is not, in my experience, a significant problem.

4 Q. Is it also correct that the pathology
5 will frequently indicate whether or not it's primary
6 or metastatic?

7 A. The pathology will suggest at times. It
8 is not -- as I said, lung cancer can present in many
9 different ways histologically. It has a whole
10 spectrum of changes that occur. And so that's part
11 of what we do in conferences. We say, "Does the
12 pattern that we see under the microscope match what
13 we're seeing clinically?" And if there's some
14 disagreement between them or a suggestion of
15 disagreement, we track it down.

16 Q. You've discussed for me the various
17 diagnostic tools that you use and what
18 determinations are made from those, and I believe
19 one of the things you mentioned is that a complete
20 history is taken. Correct?

21 A. That's correct.

22 Q. Why is that important?

23 A. The history has several elements to it.
24 One is, as we build a database about that patient,
25 understanding, "What are the unique aspects of this

1 patient? Do they have allergies? Do they have
2 other problems that are going to impact on their
3 therapy?" in any given direction. "Have they had
4 something before? Is there something I need to know
5 about that's going to change how I think about their
6 therapy?" And I think that that's a compulsion
7 among us, to do that accurately in a consulting
8 sense.

9 I need to know, for example, that someone
10 has been a heavy smoker because not only am I -- I
11 don't use it to chastise them, but not only do I
12 know that was the cause of what they have, but I
13 know that that's going to have impacted their
14 pulmonary function and their cardiac function and
15 that that may seriously limit how I can treat them.

16 And so, the minute I know that they've
17 been a three-pack-a-day smoker for 20, 25 years, as
18 opposed to a pack a day for 15 years, and put that
19 together with their age, I'm going to say, you know
20 -- already, even as I'm taking that history and
21 listening to it -- "Okay. I need these extra tests.
22 I'm going to have to make sure about his breathing
23 function, about his cardiac function, if we're going
24 to do any surgery on this patient." So, I mean, it
25 helps you distinguish that as you go along.

1 You're also looking for, as I mentioned
2 earlier, what's called "catastrophe management."
3 And whether it's at time of diagnosis or later
4 on, there are certain things, like back pain or
5 confusion or headaches or double vision, that tip
6 you off that a medical catastrophe is about to
7 happen, whether it's spinal cord compression and
8 paralysis or whether it's seizures and coma --
9 developing a coma from brain metastasis.

10 You need to listen very carefully in the
11 history and sort them out, so that no matter whether
12 you can lengthen their life one day or not, every
13 day of that life is spent walking, talking,
14 interacting with family and the like.

15 Q. You -- a couple of times during the
16 course of your deposition now, you've mentioned
17 pulmonary function tests and things of that nature.
18 Perhaps one thing I didn't ask you about earlier is:
19 Do you consider yourself an expert in the area of
20 pulmonary function tests and pulmonology?

21 A. Yes, with the provisos I've given before:
22 Although I'm not board certified in pulmonology, I
23 am a fellow in the American College of Chest
24 Physicians through my expertise in lung cancer,
25 and how that overlaps -- you cannot do lung cancer

1 without becoming an expert in pulmonary medicine,
2 because you have to distinguish those things all the
3 time, and you work with pulmonary function tests
4 every day.

5 What I don't do are the critical care
6 issues. It's the other half, the ICU management,
7 ventilator management of people, and some of the
8 infections, but -- so, yes. And I'm prepared to
9 testify about pulmonary functions, what extent are
10 appropriate, inappropriate for various types of
11 therapy.

12 Q. And in your experience, Doctor, have you
13 seen patients that have been diagnosed not only with
14 lung cancer but also with COPD or other pulmonary
15 diseases?

16 A. Yes.

17 Q. Okay. And how do those two interact or
18 affect each other?

19 A. They almost always run together. People
20 who smoke heavily will, a proportion of the time,
21 develop lung cancer. A far greater proportion of
22 the time, they will develop what we call chronic
23 obstructive pulmonary disease, which has many
24 manifestations, from bronchitis through emphysema;
25 and, in fact, may have no clinical manifestations.

1 They may not be short of breath. But if you
2 actually measure what their capacity, what their
3 reserve is, they've lost a significant amount of
4 that capacity and reserve through their smoking
5 behavior.

6 Q. And those percentage of people who have a
7 pulmonary disease and do not have lung cancer, you
8 don't treat those kind of patients yourself, do you?

9 A. On occasion, people who have had a prior
10 cancer, who do have chronic obstructive pulmonary
11 disease, who -- that gets worse in the course of
12 them seeing me in follow-up or whatever, yes, I will
13 frequently manage those patients.

14 And, of course, in the area of lung
15 cancer, those patients frequently have exacerbations
16 of their chronic pulmonary disease.

17 And when I originally talked about what I
18 did in terms of being the primary care specialist
19 for a patient, managing their chronic obstructive
20 pulmonary disease with all of its components is
21 something that I do on a regular basis, and have for
22 many years.

23 Q. Do you treat patients who have pulmonary
24 diseases without a history of lung cancer? In other
25 words, do you typically treat a patient with

1 emphysema, asthma, things of that nature, that don't
2 have a cancer component and never have had one?

3 A. Not typically, but frequently. In other
4 words, the patients that I see who had a prior
5 breast cancer or something else, who I'm seeing as
6 -- either because I've picked them up when I'm on
7 the inpatient service or whether they've been
8 referred to me by -- on a VIP basis, or whatever --
9 a friend of somebody, friend of Mr. Moffitt's or
10 anybody else. If I'm seeing that patient and they
11 happen to have chronic obstructive pulmonary
12 disease, I treat it in that setting. I don't
13 usually refer those patients on.

14 Q. Are you prepared, and do you intend to
15 offer expert testimony regarding the association
16 between cigarette smoking and pulmonary diseases
17 which do not have a cancer component?

18 A. To the extent that I -- that I know that
19 smoking causes COPD, that there are only a handful
20 of allergic and infectious problems that will cause
21 that picture, that the overwhelming majority of it
22 is due to smoking, that the evidence for that is the
23 same compilation of epidemiologic and clinical and
24 research evidence that there is for smoking, yes,
25 I'm prepared to speak to that.

1 Q. We were talking about the history that
2 you typically want to take or would take in a
3 patient who presents with lung cancer. Is there a
4 standard questionnaire that's used at Moffitt?

5 A. Yes, there is.

6 Q. I'm sure it's lengthy and has a lot of
7 questions on it, but can you cover for me, Doctor,
8 the basic subheadings or categories of --

9 A. Yes, I can.

10 Q. -- of questions that are covered on that
11 questionnaire?

12 A. The first thing that we have is a section
13 that asks the patient to describe in their own words
14 what happened, and it's basically a blank page like
15 this with lines on it, and that allows the patient
16 to write down, "I was diagnosed with X" or to write
17 out that long history they like to about this and
18 that test and where they went and which doctor did
19 this and where they did that and that they thought
20 it was due to whatever and -- they get to put their
21 whole story down, but it's in their words, okay?

22 Then we ask them a general sense of,
23 "Before all this started, how did you feel?
24 Excellent, good, fair, poor." And "How do you feel
25 now?" Sort of get a sense of what's happened to

1 them.

2 The next piece we ask -- unique now to a
3 cancer center -- is "Have you had any prior
4 treatment for this cancer?" Because that influences
5 what we can do. That's a separate page.

6 We then turn to a next page, which is
7 "Family History," where we ask: What other diseases
8 have been in their family; what other family members
9 they have; are they alive or dead? Do they have --
10 if they're dead, what did they die of? If they're
11 alive, do they have any significant illnesses? --
12 again, looking for patterns within families of
13 certain diseases or other things we need to watch
14 out for.

15 The next page is what we call "Social
16 History," and on that page is a section at the top
17 of the page on their habits. Those include a
18 detailed smoking history, a history of alcohol
19 consumption and history of drug usage.

20 The second half of that page are -- is
21 a series of what we call "social supports." It
22 asks the patient whether or not they have certain
23 characteristics that we associate with the need for
24 psychosocial counseling and intervention. Do they
25 live alone? Do they have someone helping them? Are

1 they having problems with transportation, et cetera,
2 et cetera. Anytime they check one, we know that
3 patient is going to have trouble with therapy.

4 Are you comfortable your insurance will
5 cover this, et cetera. So we ask those questions,
6 and that tells us -- of the 15 patients we're seeing
7 today, only two or three are going to have hits, are
8 going to have positive findings there. And that's
9 who the social worker sees. She can't see all 15
10 of them, so we focus on the people that need that.

11 Then we turn to their employment history.
12 We ask them where they've worked, what kind of jobs
13 they've had, whether they've had particular
14 industrial exposures of any kind, any kind of
15 occupational or workplace exposure, anything
16 unusual. If they give us a hint of that, then we'll
17 pursue that in more detail.

18 And then there's a several-page section
19 on what we call a "Review of Systems," and we ask
20 salient points of specific symptoms for every organ
21 system in the body, hoping to isolate one of two
22 things: A) A history of something that's happened
23 before; or, secondly, whether or not they have any
24 of the potentials for catastrophic illness that they
25 themselves have not put together. The patient with

1 brain metastasis may think their headache or their
2 trouble with reading is just a change in their
3 eyeglass prescription. But when I see headache or
4 double-vision on that sheet, I'm off ordering
5 something looking for a spread to the brain, because
6 I know that pattern. They may not know it as
7 someone who is medically naive.

8 That's the form. And then the last page
9 is: What questions do you have? What things would
10 you like us to answer for you? It's a good form.

11 Q. Family history. In taking family
12 history, and in your experience in oncology, is
13 there a pattern of lung cancer running in families?

14 A. Yes, I believe there is. We're starting
15 to see pretty clear evidence of that now. That
16 comes from several sources.

17 The history, with all of these cancers,
18 has been the degree to which we can find it running
19 in families, first; and then, secondarily, identify
20 the specific gene that's abnormal.

21 Now, there are some cancers where the
22 relationship to a family history is overwhelming.
23 Breast cancer in women, for example. If your sister
24 and your mother have had breast cancer, you're a
25 walking time bomb for that. And we can actually now

1 get down to the specific gene for that in some
2 percentage of women with breast cancer.

3 In lung cancer, that data has been less
4 clear. We see, however, that there's a two- to
5 threefold risk, that if a first-degree relative
6 who's been a smoker has had a prior lung cancer,
7 that you yourself have a higher risk than others who
8 don't -- or other smokers who don't have that family
9 history. And that goes into that multifactorial
10 aspect. The sum of all these things that happen to
11 someone results in an individual risk pattern for an
12 individual.

13 So if I have a family history of heavy
14 smokers, all of whom get lung cancer, and I've had
15 two or three deaths from that in the family -- and
16 that's not uncommon; I see that frequently in my
17 practice -- people sort of sitting there, going
18 (indicating) -- making these gestures, you know, "I
19 wish I had figured that out earlier in my life" --
20 that if I see that in a family, and I've got a
21 smoker in front of me with a mass on chest x-ray,
22 it's not hard to extend.

23 But when I calculate risk for an
24 individual who doesn't have cancer -- for any one of
25 us, for example -- it's that combination of whatever

1 their genetic risk is -- and that's, in itself,
2 multi-factorial -- with whether or not they smoke.

3 So the person who has the genetic risk
4 who never smokes has a risk of lung cancer that's
5 down where the average person is, and so we have to
6 -- you have to sum those two things -- those two --
7 50 different things that add up to an individual's
8 risk of developing lung cancer, and family
9 background is one of those. It's not as strong as
10 it is for other cancers, but it is clearly present.

11 Q. Is there a generally-accepted percentage
12 risk that is associated with a strong family history
13 of lung cancer and -- in case I'm not asking this
14 well -- in other words, do you generally know that a
15 person with a strong family history of lung cancer
16 has a 10 percent increased risk or a 20 percent
17 increased risk? Is there a statistic associated
18 with that?

19 A. Two- to threefold, if they're smokers.

20 Q. What if they're not but have a strong
21 history of it in their family?

22 A. Then there doesn't appear to be an
23 increased risk.

24 Q. Not to jump around -- I'll come back to
25 the genetic and the history for just a moment, but

1 another question just popped in my mind. We were
2 talking a little while ago about pathology,
3 determining primary site versus metastases.

4 Is the use of immunohistochemical testing
5 a method by which you can determine 100 percent of
6 the time the primary site of the cancer?

7 A. No.

8 Q. Okay. What is the percentage
9 of reliability, if you will, for using
10 immunohistochemical testing on a tissue sample
11 to determine original site of cancer?

12 A. It's actually relatively low.

13 Q. Really?

14 A. Yes. The -- we would think that's the
15 case, that it should be very high and very specific;
16 but, in fact, it turns out it's not, and it turns
17 out that there's a great deal of overlap in tissues.

18 The fundamental problem is that cancer is
19 not something foreign. It is a part of the -- your
20 -- the individual that's run amuck. And so the
21 cancer cell has carried with it -- even though it's
22 growing wildly, those controls are lacking -- it
23 still carries with it all that information that it
24 had as a normal cell. It's not like measles or
25 mumps or tuberculosis, which carry unique pieces of

1 information that the body can recognize.

2 So, yes, we use immunohistochemistry
3 all the time; and, yes, it is very helpful in
4 distinguishing some forms of cancer, but there's
5 a great deal of overlap. In fact, you'll see
6 a couple of my papers relating to the use of
7 immunohistochemical markers in lung cancer, and both
8 of those papers show that it is not helpful to run a
9 battery of immunohistochemical markers; that it does
10 not distinguish small cell from non-small cell or
11 good prognosis from bad prognosis. So that's where
12 my opinion comes from on that.

13 Q. Is the use of immunohistochemical testing
14 more reliable on certain types of cancers as opposed
15 to others?

16 A. It's more reliable in answering certain
17 types of questions than it is in others.

18 Q. And what types of questions would those
19 be?

20 A. Yes. And I wasn't being difficult.
21 I knew you were going to ask the types.

22 Q. I knew you weren't.

23 A. I think that there are certain questions
24 about whether or not we see the presence or absence
25 of certain things. Mucin, for example, or carcino-

1 embryonic antigen are two compounds that if we see
2 them, we know, then, that that cancer is not a
3 mesothelioma.

4 If we see certain other ones, we
5 know that it's more likely to be a sarcoma than
6 something else. But the number of times where that
7 information is what tips the balance in a diagnosis
8 versus this group that -- where it has no -- I mean,
9 if we get it, it's nice, and it's there, and it's
10 confirmatory, but it didn't help us with the answer;
11 occasionally sorting out whether an adenocarcinoma
12 came from the ovary or not. It's helpful; but even
13 there, lung cancer is -- you know, the specific
14 antigen for ovarian cancer is CA-125. Well, the
15 second place that makes that, most commonly, is lung
16 cancer. So it doesn't really help you to do that.

17 CEA can be made in the bowel; it can be
18 made in the lung; it can be made in the breast. It
19 doesn't help you. So the specificity of using those
20 tests is not that great, and I -- we use it --
21 maybe five or ten percent of patients' immunohisto-
22 chemistry actually helps us sort out a particular
23 question, but no more than that. We may get it on
24 70 percent of patients, but that doesn't mean it
25 helps us.

1 Q. Thank you. Back to the subjects we were
2 discussing on history, I want to make sure I
3 understood something that you said a few minutes
4 ago. We were talking about the strong family
5 history of lung cancer for a non-smoker -- or in a
6 particular patient who's a non-smoker.

7 Is it your testimony that that individual
8 has no increased risk of contracting lung cancer?

9 A. If I see someone who has -- one of their
10 parents, for example, was a smoker and had lung
11 cancer from that, okay, and now that person comes to
12 me in a social situation, or whatever, and I don't
13 think they have cancer. I mean, they're asking me,
14 "What's my risk?" Okay.

15 The first thing I ask is: Do they smoke?
16 If they smoke, I'll say, "I'm concerned about your
17 risk. I think it's two or three times higher than
18 even other smokers whose risk is 30 or 40 times what
19 a non-smoker's is."

20 But if you are a non-smoker, and have
21 been, and were not exposed to your parents smoking
22 in a confined space for many, many years, then you
23 probably have no increased risk over anybody else
24 walking around who has been a non-smoker. There's
25 always a background noise of cancers that will arise

1 in true non-smokers, lung cancers that will arise in
2 true non-smokers. That's what we used to see before
3 the 1900s, those little background noises, an
4 uncommon but described cancer. So that's what I
5 would tell them.

6 Q. Are you familiar, Doctor, with any
7 current studies or data indicating that the
8 incidence of lung cancer is on the increase; yet,
9 the number of adults or individuals who are
10 consumers of tobacco products is decreasing?

11 MR. SCHLESINGER: I'm going to object to
12 that. If you have data along those lines, give
13 it to him and ask him if he agrees with it.
14 A supposition as far as data is concerned
15 perforces that there is such data and,
16 therefore, I object to it.

17 BY MS. ECKELS:

18 Q. You can still answer the question,
19 Doctor. I'm asking: Are you familiar with or are
20 you aware of any such data?

21 A. I am familiar with data, and before --
22 before I answer that, I need to explain what that
23 data is --

24 Q. Sure.

25 A. -- because, in point of fact, your

1 question made a supposition about it that's
2 inaccurate. The -- or that I think is inaccurate.

3 The data as we have it is that in men,
4 for some years now, the rate of smoking has
5 diminished; and that, for the first time, we are now
6 beginning to see a diminishment in the number of
7 deaths due to lung cancer, both the incidence of
8 lung cancer and the number of deaths due to lung
9 cancer in men.

10 Women who started smoking long after
11 men didn't start their -- men started their heavy
12 smoking history around World War I. Women didn't
13 start until around World War II.

14 Women, on the other hand, are still
15 increasing, both in -- now, the number of smokers,
16 adult women, has leveled off some, but the number of
17 cases of lung cancer and the death rates from it
18 continues to rise in epidemic proportions.

19 The place where there is a dramatic
20 increase in smoking behaviors is among adolescents,
21 particularly adolescent females; and in particularly
22 -- felt very strongly to be related to the advertis-
23 ing campaigns for that. And so what we see are --
24 it depends on what piece of the data you want to
25 look at. Okay? If you want to look at men, yep,

1 rates are going down. But if you want to say,
2 overall, are more people smoking? No. Smoking
3 is down all over, but not in certain groups.

4 So you have to -- you have to -- we have
5 to take which part of that data we want to look at.
6 All the data is there. And what it shows is, if you
7 smoke for a prolonged period of time, you get lung
8 cancer. And if you, as a group -- whether that's,
9 you know, the adolescent females of today who are
10 all taking up smoking -- 20, 25 years from now,
11 we're going to see an epidemic of them getting lung
12 cancer, as night follows day.

13 The same as the -- women started smoking.
14 They got emancipated from smoking restrictions
15 around World War II. Bam, up went their smoking
16 rates, and you can follow it in any country, any
17 country where they -- where there's -- where
18 the smoking behaviors were truncated by war
19 or famine or economic conditions, and they suddenly
20 change and the smoking rates go up. Just wait
21 20, 25 years, and there it is.

22 The Japanese, for example, had a much --
23 were not heavy smokers before World War II. With
24 the American occupation, they became significant
25 smokers, and now we're just starting to see an

1 epidemic of lung cancer in Japan as well.

2 Q. Do you attribute any of the statistics
3 showing a decrease in deaths due to lung cancer due
4 to the fact that detection and treatment has
5 improved?

6 A. I think a small portion of that is -- as
7 I have said in several editorials, is due to
8 improved treatment.

9 Our detection, I don't think, is
10 particularly improved yet, although I'm involved and
11 chair several studies in that area. I don't think
12 we've made major -- major advances in our ability to
13 detect it early. Hopefully, that will change in the
14 next couple of years, but not to date.

15 Our treatment is better. We've probably
16 improved treatment outcome by four to five or six
17 percent maximum over the last 20 years, but it seems
18 very clear that the -- the decreased incidence and
19 death rate from lung cancer is due to the fact that
20 somewhere in the '60s and '70s, men, in particular
21 -- in fact, the first group as a whole were white
22 male British physicians who, almost to a person,
23 stopped smoking -- almost as a group. It was a
24 phenomenal sociologic change. And starting with,
25 oftentimes, physicians, but going right through the

1 male population, the dramatic decrease in smoking
2 among adult males has been followed by, as we would
3 hope and expect, finally, a leveling-off and now a
4 decrease in the incidence and death rates due to
5 lung cancer.

6 Q. I'm going to object to the last part of
7 your answer as being nonresponsive to the question.

8 MR. SCHLESINGER: You may not have liked
9 it, Counsel, but it was --

10 MS. ECKELS: It was nonresponsive.

11 MR. SCHLESINGER: -- completely and
12 totally responsive to the question.

13 MS. ECKELS: My objection stands. I
14 object to it as nonresponsive to the question.

15 MR. SCHLESINGER: Overruled.

16 MS. ECKELS: Well, fortunately, you're
17 not the judge.

18 BY MS. ECKELS:

19 Q. In talking about family history, what
20 other factors are you interested in determining
21 other than the incidence of lung cancer within the
22 family?

23 A. Obviously, I'm looking at other --
24 whether they have other cancers. I'm looking, do
25 they have a history of unusual lung disease, kidney

1 disease, liver disease, something else that might
2 impact on my ability to treat them.

3 People with -- one of my practices used
4 to be in Saranac Lake, which was the place they sent
5 all the tuberculosis patients from New York City.
6 It was a huge TB sanitarium up there, and so we
7 would frequently see people who had been treated
8 for TB 30, 40, 50 years ago who had been smokers.
9 They now came in with lung cancer, and lung cancer
10 frequently obstructs airways and causes changes out
11 further in the lung. And I can't tell that from
12 tuberculosis or infection due to the lung cancer.
13 And some of these people would have reactivated
14 their TB, so I'm going to ask. If they've had a TB
15 exposure, that's just one more thing I keep in mind
16 as I go down the litany of things I'm looking for in
17 a patient.

18 If they've got a history of polycystic
19 kidney disease and I'm thinking about treating
20 them with chemotherapy that includes a platinum
21 derivative that's going to put a whack on their
22 kidneys, I want to know that before I start treating
23 that patient. So those -- I mean, those are just
24 the routines that we would ask.

25 Q. Is there a section on the history form

1 for them to either check off or list all of the
2 various diseases that they're aware of within their
3 family tree?

4 A. Um-hum. Yes.

5 Q. Does that include diabetes?

6 A. Yes.

7 Q. Does that include elevated cholesterol?

8 A. Yes. I'm sorry. It includes heart
9 disease. It doesn't specific elevated cholesterol.

10 Q. Have you done any type of a comparison,
11 or are you aware of any of the differences in the
12 family histories of those Medicaid patients that you
13 have treated versus the non-Medicaid?

14 A. No. I think the -- there are
15 differences by socioeconomic status in family
16 histories. Frequently those are related to access
17 to early medical care. We see them whether they're
18 Medicaid patients or non-Medicaid patients. But
19 aside from that issue -- there are also differences
20 by racial or ethnic subgrouping; and depending on,
21 in a particular city, what those may be, there may
22 be differences there, but they -- they are not based
23 on their Medicaid status.

24 Q. And understanding that you see them
25 whether they are or are not a Medicaid patient, what

1 socioeconomic differences have you noticed or are
2 you aware of between the Medicaid patients that you
3 have treated and the non-Medicaid patients you've
4 treated?

5 A. Very minimal differences. I think the
6 slight difference is with respect to when they seek
7 care, their access to care, and in -- you know,
8 in New York and Florida, you have two states that
9 really have fairly decent Medicaid regulations. So
10 that provision of early symptoms -- care for early
11 symptoms is available, so you don't see some of
12 those discrepancies that have occurred in other
13 areas. So I would say, really, they're fairly
14 minimal, and I can't -- I usually don't distinguish
15 them. I often don't know who has that. I can tell,
16 at either end of the spectrum, the person who comes
17 in extremely well-dressed in a Chanel suit versus
18 the person who comes in, you know, off the street.
19 I can tell them apart, and I can suggest this one's
20 probably on Medicaid and this one isn't, but that's
21 a -- but in between, it's very hard to distinguish,
22 either clinically or socially.

23 Q. Is it important, though, to -- or can it
24 be important, though, the difference in the access
25 to health care they've had going back as far as

1 childhood?

2 A. In general, no. And the reason for that
3 is that this is a -- this is a cancer that we cannot
4 diagnose early, despite our best efforts; and,
5 therefore, whether you have absolutely spectacular
6 access to health care from childhood on, and get
7 all manner of tests right through that, there's,
8 to date, no good evidence that that will catch you
9 earlier. The early cancers we catch are usually
10 flukes, somebody coming in for a cataract operation
11 who gets a chest x-ray and it's -- it's abnormal.
12 But just routinely doing the population, there are
13 huge studies to show that it has not been beneficial
14 in early detection.

15 Q. It is -- is it important to know a fair
16 amount about the childhood in terms of childhood
17 exposures and childhood diseases and how that may
18 later relate to cancer being diagnosed in the adult?

19 A. Well, it is and it isn't. There are
20 certain areas where it is important, and I -- and
21 lung cancer, for example, I do not look to that as a
22 primary piece. I look to that as a secondary piece.

23 So if I'm sitting here and a person tells
24 me that, you know, "I've been told by my primary
25 care physician that I have lung cancer and he sent

1 me here to see you, but I've never been a smoker,
2 and I don't understand this," then one of the things
3 I will pursue is environmental tobacco smoke and
4 whether or not they had heavy exposure as a child.

5 If someone says to me, "I've smoked
6 cigarettes for 40 years at two packs a day," I don't
7 much care what their exposure from their parents
8 was, so I don't really pursue that aspect of it.

9 On the other hand, a cancer like
10 melanoma, I'm primarily concerned, if I have a skin
11 lesion there, because it is -- it is the history of
12 childhood severe sunburns that leads to adult
13 melanomas.

14 And so I want to know, did this -- did
15 you, as a child, have frequent severe sunburns? And
16 that becomes a very important piece of information
17 in that. Those are two ends of that spectrum.

18 Q. What other differences do you -- have you
19 ever noticed between family history of a Medicaid
20 and a non-Medicaid patient, if any?

21 A. None in particular.

22 MR. SCHLESINGER: That presupposes that
23 he's noticed some in the past. He hasn't told
24 you that he noticed any.

25 MS. ECKELS: Yeah, he just did. He just

1 told me about one.

2 MR. SCHLESINGER: Well --

3 BY MS. ECKELS:

4 Q. Going from family history to social -- to
5 the social history, have you noticed any differences
6 between the social history taken from a Medicaid
7 patient and a non-Medicaid patient?

8 A. Well, social history includes job,
9 smoking, alcohol and drugs. I mean, those are the
10 things we're basically looking for in those -- in
11 those areas. And, obviously, the job history of
12 someone who is on Medicaid is frequently different,
13 again, at the ends of the spectrum.

14 But in the middle of the spectrum, there
15 are plenty of people who are just off of the
16 Medicaid range who hold the same jobs with the same
17 exposures; pretty hard to distinguish.

18 Someone who's a captain of an industry
19 is unlikely to be on Medicaid, I mean, at those
20 extremes. That's relatively easily -- so, again,
21 not in particular.

22 Q. You mentioned to me that a separate
23 category that you explore on the history form is
24 exposures, occupational exposures, which may relate
25 to social history --

1 A. Yes.

2 Q. -- but you mentioned it as a separate
3 category.

4 A. Yes.

5 Q. What differences have you noticed there
6 between the Medicaid and non-Medicaid patient?

7 A. Again, no particular difference in there.
8 Again, at the far extreme, there are people who have
9 been in high-level, white-collar jobs their whole
10 life, and there aren't too many Medicaid patients
11 that have been there. But in between all those
12 other industrial jobs that people have held through
13 their lives, there is no difference between Medicaid
14 and non-Medicaid.

15 Q. In discussing and in covering your
16 opinions regarding the diagnosis of cancer, we've
17 discussed the diagnostic tools, what can be
18 determined from them, the history that's taken, the
19 various staging of cancer. What other opinions do
20 you have, Doctor, related to the diagnosis of lung
21 cancer as it is associated with cigarette smoking?

22 A. Well, I -- and I thought you were just
23 going to ask about this one, so I'll give it to you
24 anyway. It's those other occupational exposures. I
25 know that if I have someone who has no occupational

1 exposure and -- because of the synergies they cause
2 with cigarette smoking --

3 If I have someone who's always had a
4 white-collar job and has never smoked, they have an
5 extremely low incidence of lung cancer. If they've
6 worked with exposure to asbestos or nickel or radon,
7 or any of the other occupational exposures, their
8 incidence of lung cancer goes up a little bit, and
9 I'll, for the camera, show this much (indicating),
10 okay.

11 If they smoke, and they're heavy smokers
12 -- and a significant smoking history I would count
13 as greater than 20 pack-years, which is one pack
14 a day for 20 years; two packs a day for 10 years,
15 however you get there, to 20 pack-years -- their
16 incidence of lung cancer climbs 60 or 70 times what
17 it would be without having that.

18 If you now put asbestos exposure, nickel
19 exposure, radon exposure, uranium miners, et cetera
20 -- okay -- if you combine that occupational history
21 with a smoking history, it goes through the ceiling
22 in terms of their risk. There's a synergy between
23 those.

24 And, again, we look to this accumulation
25 of mutations as leading to cancer. And so, if you

1 have it -- you know, you have it coming down one
2 source and now you bring it in from a few other
3 sources, you just get there earlier and frequently
4 worse, but it's just one of many changes that go on.
5 So I'm looking for that as part of the occupational.

6 Sometimes that will tip me towards trying
7 to sort out the difference between lung cancer and
8 mesothelioma, which is an issue at times; but,
9 again, that's what I would use in the social
10 history.

11 Q. Have you seen and/or treated patients,
12 Doctor, who had no smoking history, but yet
13 significant occupational exposures and who developed
14 lung cancer?

15 A. Actually, I don't believe so. I think,
16 in my -- and I have an extensive group of those
17 patients -- I have seen a fair number of
18 mesotheliomas in patients who are non-smokers but
19 who had significant asbestos exposure, but I don't
20 think I've ever seen one who just had a lung cancer
21 with no smoking history.

22 Q. Do you have any other --

23 A. They exist. That's just my personal
24 experience. I'm sorry.

25 Q. Do you have any other opinions, Doctor,

1 regarding the diagnosis of cancer --

2 A. No, I don't.

3 Q. -- as it relates to cigarette smoking?

4 A. I don't believe so.

5 Q. Let's move to one of the next areas,

6 Doctor, that you --

7 A. Could I ask if we'd take a quick bathroom
8 break?

9 Q. Of course.

10 THE VIDEOGRAPHER: We're off the record
11 at 2:30.

12 (There was a recess from 2:30 p.m. until
13 2:40 p.m.)

14 THE VIDEOGRAPHER: The time now is 2:40.
15 We're on the record.

16 BY MS. ECKELS:

17 Q. Doctor, I believe we had just completed
18 covering your various opinions as it relates to the
19 diagnosis area of your testimony. I'd like at this
20 point to discuss with you your opinions and the
21 basis of your opinions as it relates to causation,
22 if I may.

23 What is your opinion regarding the
24 causative or causal connection between lung cancer
25 and cigarette smoking?

1 A. Smoking causes lung cancer. That's about
2 as succinct as I can get.

3 Q. And are there any particular studies or
4 texts or data which you can identify for me today
5 that you rely upon in reaching that opinion?

6 A. No -- oh.

7 MR. SCHLESINGER: Let me do this with
8 you, counsellor. Peculiar to the Florida Rules
9 of Evidence are that you cannot augment your
10 testimony with learned treatises.

11 If you wish to waive that, I have no
12 objection to the doctor referring to them,
13 relying upon them, or in any other manner
14 expounding upon them. What's your druthers?

15 MS. ECKELS: Let's go off the record.
16 I don't want to eat time discussing this.

17 THE VIDEOGRAPHER: It's 2:41. We're off
18 the record.

19 (Discussion off the record.)

20 THE VIDEOGRAPHER: We're back on the
21 record at 2:42.

22 MS. ECKELS: Would you read back my last
23 question?

24 (The requested portion was read back by
25 the reporter.)

1 THE WITNESS: No, I don't -- you know,
2 you're asking me to take a lifetime's work and
3 to say, "I have this opinion because of this
4 particular paper or this particular article,
5 and that's not the case. It's the sum and
6 substance of 25 years of knowledge, starting
7 all the way back in biology in college, all
8 through medical school, all through training,
9 all through my experience on the faculty, of
10 all the various papers, all the various
11 journals, all the various discussions, the
12 thousands of conferences, et cetera, where this
13 issue has been discussed, that leads me to my
14 opinion of that.

15 I don't have a single paper, and I
16 don't think there is a single paper or book
17 that says, you know, "Here is the absolute."
18 It's the sum and substance of that data that
19 leads me to that conclusion.

20 BY MS. ECKELS:

21 Q. Are you prepared to explain today,
22 Doctor, the medical process by which cigarette
23 smoking, in your opinion, causes lung cancer?

24 A. In general terms, yes.

25 Q. Please explain it.

1 A. The -- lung cancer, like any other
2 cancer, is the summation of a series of events that
3 damage the genetic material of an individual cell.
4 Now, obviously, it does it to many cells at the same
5 time, but we're interested in that one cell that's
6 going to become malignant.

7 And so, if it takes eight or ten
8 different mutations -- and we really don't know how
9 many it takes for lung cancer yet -- we know it's
10 several. We've identified several of those changes
11 to date but don't know all of them yet.

12 It's the summation of those that finally
13 takes a cell over that boundary from reversibly
14 damaged to irreversibly damaged and malignant.
15 And that, through any number of the constituents
16 of cigarette smoke, whether it's the benzopyrenes,
17 the radon, all the other -- bay region diol-epoxides
18 that are in there. All the various compounds that
19 are in smoke have a cumulative effect on those
20 cells. The sum of those results in lung cancer.

21 Whether each individual patient or each
22 individual person has any or all of those specific
23 changes due to each specific compound, I think is
24 almost unknowable in its complexity; but, clearly,
25 the sum of several of those hits, as you will, to

1 the genetic material of a pulmonary cell leads to
2 the development of cancer.

3 And I think that -- and I'm -- in any of
4 these -- in several areas -- for example, in colon
5 cancer, we have six or seven genetic alterations
6 that occur in a row, and we've identified four or
7 five of those pretty clearly.

8 In lung cancer, it's at least four or
9 five. It's probably more like eight or ten changes
10 that we are coming up on and identifying, and we've
11 probably identified three or four of those with some
12 specificity. But we know that there's this
13 accumulation of genetic changes in a certain point.
14 That's it. That cell is irreversibly damaged, and
15 it becomes -- it starts to grow without control.

16 Q. Which of these eight to ten mutations are
17 now -- or can you describe with some specificity?

18 A. I think the changes that occur in the p53
19 gene and the ras oncogene, I think those are changes
20 that we have with some specificity. We understand
21 some of the other interactions but not all of them.
22 I think that -- I mean, I can go back and refer
23 to individual pieces of that, but I don't think we
24 -- we don't have -- I know we don't have the full
25 sequence of changes that lead.

1 We can find people who have alterations
2 in p53 or retinoblastoma gene or in the ras gene --
3 or in the ras protein -- that are associated with
4 and appear to be one of the steps. But the full
5 sequence and how they interact with each other, we
6 don't know yet. And in each of those, smoking has
7 been associated with them. And, in particular, the
8 most recent one is the changes in the p53 gene.

9 Q. Do these genetic changes in the lung
10 occur in all smokers?

11 A. Actually, it turns out they probably do.
12 When we look at normal tissue in smokers -- and the
13 very earliest studies of these were actually
14 cytologic. If we look at, for example, studies that
15 were taken of people killed in the Korean War, and
16 then that study has been repeated -- where people
17 who were young kids in their early -- late teens,
18 early twenties -- who smoked, versus those who
19 didn't smoke and who were killed either in combat or
20 killed in auto accidents, et cetera, the cytologic
21 changes were far greater in the smokers. The
22 pre-malignant changes were far greater.

23 If we take a patient -- and the data I'm
24 probably most familiar with -- and look at the
25 cellular and molecular changes in the surrounding

1 normal tissue of a lung -- of a patient who has lung
2 cancer in, say, the right upper portion of the lung
3 -- if we examine autopsy tissue from the left lower
4 portion of the lung, the frequency of strand breaks,
5 the frequency of mutations is far higher in smokers,
6 and it's far higher in that distant tissue than it
7 is in the tissue of nonsmokers.

8 Q. If these mutations occur, as you stated,
9 in all smokers, then how do you account for the fact
10 that a percentage of smokers will develop lung
11 cancer and a percentage of smokers will not develop
12 lung cancer?

13 A. Two major reasons. Number one, as I
14 said, it's a summation of several different changes.
15 What -- what those changes are, how many of them are
16 required for each person is what's unclear.

17 For example, one of the things that we
18 have is a capacity for what's called DNA repair.
19 Whatever -- and you don't need DNA translated, do
20 you? Is that all right? Can we just --

21 Q. That's okay.

22 A. -- because I can never pronounce it.

23 Q. That's okay.

24 A. As you walk down the street in the sun,
25 as you go anyplace, you have a certain amount, as

1 you -- just as you go through life replicating your
2 skin, your blood cells, your intestinal lining
3 cells, every -- your hair, everything that you have
4 that's growing, there will be a certain number of
5 mutations that occur. And your ability to repair
6 them is your DNA repair capacity, and there are a
7 whole series of ways you do that.

8 But there are a series of techniques that
9 the body uses to repair damage. If those enzymes
10 and those systems are intact, then the number of
11 mutations you need to incur before you get lung
12 cancer is far greater, because you keep repairing
13 the ones that you get.

14 If that's damaged -- and there are some
15 diseases, such as xeroderma pigmentosum --
16 x-e-r-o-d-e-r-m-a, p-i-g-m-e-n-t-o-s-u-m -- that are
17 characterized by a failure of DNA repair, and these
18 people walk out in the sun. And before they go back
19 in the house, they got a skin cancer. I mean, I'm
20 exaggerating only slightly in that instance, but
21 that's a DNA repair deficit.

22 So if the change you happen to get early
23 on is to your DNA repair mechanisms, it only takes a
24 couple. If your DNA repair mechanisms are in shape,
25 you may never get there. I mean, you may never

1 accumulate enough changes to develop cancer.

2 The second piece is that a huge
3 proportion of these people die of premature
4 cardiovascular and pulmonary disease before they
5 have a chance to develop lung cancer.

6 Q. I'm sorry. You said that last part
7 quickly. In your opinion, the second reason is that
8 several of them expire due to premature --

9 A. They die early from COPD, emphysema,
10 coronary artery disease, peripheral vascular
11 disease, strokes, all the things that are associated
12 in addition with smoking. And if you -- you know,
13 if you die at age 60 of a stroke or a heart attack
14 or emphysema and don't live to 70, when you were
15 going to accumulate enough genetic changes to
16 develop lung cancer, then you don't get the lung
17 cancer. Small consolation.

18 Q. One's DNA repair capacity, can that be
19 replenished or adjusted in any way medically?

20 A. Very unclear. There are a whole series
21 of questions -- from diet, from Vitamin A
22 derivatives, from antioxidants, that whole array of
23 preventive compounds, selenium being the most recent
24 one of them -- that would suggest, in the
25 premalignant phase, that you may be able to reverse

1 some of these changes. But once the change to a
2 malignant cell has occurred -- once that domino
3 flips over, you can't get that back up, and you --
4 there's no amount of change in DNA repair or
5 anything else that these things would allow you to
6 do that.

7 So it remains to be seen whether or not
8 there is some benefit. We, in fact, know there's
9 some risk. We know now that beta carotene, which
10 everyone thought was quite benign -- if you give
11 beta carotene to smokers to prevent the development
12 of lung cancer, not only does it not work, but they
13 develop more lung cancers and die earlier than
14 people who don't take beta carotene. So we still
15 have a very poor understanding of how those dietary
16 and nutritional supplements impact risk. But all of
17 that data is based on what it may do in the
18 premalignant phase and nothing on reversing from
19 malignant to nonmalignant.

20 Q. Is another possible explanation for
21 a reason why someone with a smoking history may
22 or may not ever contract lung cancer the genetic
23 predisposition regarding the p53 gene, whether or
24 not theirs is particularly strong or particularly
25 weak?

1 MR. SCHLESINGER: Let me object to that
2 question on this basis: If we're considering
3 evidentiary considerations here, I don't think
4 the Doctor is talking about possibilities. If
5 you wish to talk about possibilities, that's
6 fine, but that's not another possibility. The
7 Doctor here is talking about what he believes
8 causes those conditions and diseases. If you
9 want to talk about possibilities, I have no
10 objection, excepting when you say "another
11 possibility." I don't think the Doctor is
12 talking about possibilities.

13 BY MS. ECKELS:

14 Q. You can answer the question, Doctor.

15 A. Again, this is a summation of events.
16 The changes in the p53 gene are not all the same.
17 It can be -- it can be mutated in any number of
18 different places, and those mutations have varying
19 effects on the function of the gene and the function
20 of its products.

21 And so I'm sure some of the variability
22 is due to how much of that gene is made
23 malfunctional and what the sum of that is, starting
24 with -- I mean, if you just take a series of
25 dominos. What are you born with? What are the

1 genetic deficits that you have in not only repairing
2 DNA but handling compounds? I can tell you, with
3 some certainty, that of the six of us in this room,
4 that if you took any number of test compounds and
5 administered them to the six of us, there would be
6 variation on how our body handles those drugs and
7 those compounds, detoxifies them, metabolizes them,
8 et cetera. It's built in. Does it matter? No.
9 It's just random variation in the genetic code.

10 Well, the same thing happens here. It's
11 a random variation in those -- in those damages that
12 occur and in how they sum up to prevent that cell
13 from repairing itself and ultimately let it turn
14 into a situation where it can.

15 So, yes, how much p53 is damaged, whether
16 it's damaged at this locus or that locus, they're
17 all there, and it's -- it is very complex, and we
18 don't have every single piece of it. What we do
19 know is if you start over here and you don't smoke
20 and you come over here, we're going to find far
21 fewer genetic changes and far fewer lung cancers
22 than if you start smoking heavily over here, add
23 that up for 20 years. The genetic changes are there
24 and the lung cancer is on the other side of that.

25 Q. Would you agree with me, Doctor, that

1 there's still a lot to learn in the field of
2 genetics?

3 A. There's a lot to learn about everything,
4 genetics included.

5 Q. Okay. You listed for me earlier two
6 reasons why, in your opinion, a smoker may not
7 develop lung cancer, and you mentioned the DNA
8 repair capacity and the premature death due to
9 COPD or heart disease or such things.

10 Are you -- is it your testimony that
11 those are the only two reasons?

12 A. No.

13 Q. Okay. Are you aware of any others
14 or just -- those are the two things that you're
15 prepared to express today?

16 A. Those are the ones I'm -- the ones I'm
17 prepared to express today. I'm sure there are
18 others. I haven't really given it a -- that's not
19 something I've given a great deal of thought, to the
20 "other" aspects of it.

21 Q. Okay. The second reason you listed,
22 premature death due to, for instance, heart disease
23 -- is it your testimony that that heart disease is
24 always going to be related to a smoking history?

25 A. Heart disease is exactly like cancer in

1 this respect. It is based upon an accumulation of
2 events. In this disease, we have isolated the genes
3 a little bit more carefully. We know that there are
4 some very specific genetic deficits in how we carry
5 fats or cholesterol through the blood; that people
6 who have them, if they have a severe case of that,
7 are going to get premature disease, unless we take
8 remarkable preparations to reduce their cholesterol
9 and fat load.

10 On the other hand, there are a lot of
11 variations on that that aren't quite as severe.
12 And then, if you have that, but you always have
13 a healthy diet and you always reduce fat and
14 cholesterol in your diet, and you don't smoke,
15 you're very unlikely to see heart disease.

16 Whereas, again, you add them all up.
17 If you take the dietary changes and you add them
18 together with a smoking history, you just keep
19 adding on in a synergistic way, these changes, and
20 you wind up with earlier and more severe cardiac --
21 cardiovascular disease.

22 Q. Do you know what percentage of smokers
23 never develop lung cancer?

24 A. Yes.

25 Q. What would that percentage be?

1 A. Approximately 90 percent; high 80s to 90
2 percent don't develop lung cancer.

3 Q. Are you able to explain or to state which
4 constituents within tobacco correlate or, in your
5 opinion, have a causal connection to which
6 mutations?

7 A. I'm not prepared to do that today. I'd
8 have to go back and -- I mean, it's a literature
9 that's this wide on each -- each of the compounds,
10 and I -- and I don't follow it on a daily basis. I
11 know it's there. I've heard the summaries of it.
12 I've listened to the discussions of it. I know
13 there are a whole series of them, but I -- I'm not
14 prepared to -- wasn't prepared to discuss that
15 today.

16 Q. Okay. Is it your testimony, then,
17 Doctor, that there is -- although you may not know
18 the names of the constituents as they link with the
19 particular mutation --

20 A. Right.

21 Q. -- that it is possible to show,
22 medically, the correlation of which constituent in
23 tobacco causes which mutation within a cell that
24 then results in lung cancer?

25 A. I'm not sure that we're quite that

1 specific in it yet. I think -- my understanding
2 of that literature -- and, again, it's not the
3 literature that I follow on a daily basis -- is
4 that, clearly, smoking causes certain malignant
5 changes now, and we've identified some of those
6 genetic changes in p53 and other genes and what they
7 are.

8 It's not clear to me that we've fully
9 isolated which of the components in cigarette smoke
10 does that. I know there are several candidates.
11 I've heard discussions about that, but I don't --
12 it's not clear to me that we have the specific one
13 in place.

14 Q. Is there any research ongoing at Moffitt
15 which would answer that question?

16 A. I don't believe there is, no.

17 Q. Do you know of any other -- and I'm not
18 sure if the right word is "chemicals" or
19 "constituents" -- but are you aware of any other
20 factors which would result in mutations other than
21 just the constituents from tobacco?

22 A. Well, as I said earlier, there is a
23 background noise of people who have no exposure to
24 anything, ever, who will rarely get lung cancer as a
25 fluke. Whether that's genetic or bad luck or

1 whatever -- I'm not sure how to describe that, but
2 it's there.

3 And then, as I described, radon,
4 asbestos, nickel -- and there are a couple of other
5 minor ones that go down the line -- all of those
6 have been described with small increases in the
7 rate of lung cancer. In asbestos' case, a more
8 significant increase in mesothelioma.

9 It's when those exposures, and that's --
10 really, any dust exposure, is how I think of it --
11 coal dust, cotton dust, any of those. If you get
12 those exposures with smoking, you increase the rate
13 of development of malignancy. But the ones that
14 have been identified -- that was my opinion --
15 I mean, the ones that have been identified, in
16 particular, include asbestos, nickel, radon, some of
17 the various things that uranium miners are exposed
18 to.

19 Q. Have you had an opportunity to
20 fully explain your opinion regarding the causal
21 connection, if any, between cigarette smoking and
22 lung cancer?

23 A. Actually, there's one other point that I
24 think is important --

25 Q. Please do so.

1 A. -- and germane to it, and I don't know if
2 you're going to come to it or not. I think it has
3 to do with an understanding that -- and I'm going to
4 sketch again -- and I will hold it up for you.

5 When we look at the lung and the airways
6 that -- wherein the cancer arises, okay? -- these
7 airways get smaller and smaller and smaller and
8 eventually form these little air sacs. And this
9 area, which is called the trachea and the main
10 bronchus, and then this area and this area
11 (indicating) are really three distinct biologic
12 areas of the lung. So that this area (indicating),
13 when it becomes malignant, tends to form squamous
14 cancers, and we call this area the central airways,
15 the squamous zone of differentiation.

16 This more medium-sized airways is the
17 secretory zone. And in that area, the things that
18 the lung secretes -- primarily mucus that lubricates
19 the lungs -- sorry to do that right after lunch,
20 but that's how we lubricate our lungs and breathe,
21 therefore -- are made in that area.

22 And when cells become malignant in
23 this area, they tend to form adenocarcinomas. And
24 when cells out in this area, which is called the
25 respiratory zone (indicating) -- the cells out there

1 are very different than the cells that are in here.
2 When these become malignant, they tend to form
3 bronchioalveolar carcinomas, and that's -- that's
4 one of the reasons we see that.

5 And in this causal role, it's this issue
6 of how far the tobacco smoke and its products get
7 out into the lungs that's been responsible for some
8 of the changes we've seen in these cell types of
9 lung cancer. We're seeing far more adenos and now
10 bronchioalveolars in smokers, and the thought is
11 that what's happening is -- in the old
12 Chesterfields, if you will -- and I don't know who
13 makes them, so I'm not picking on one, but that's
14 the traditional non-filtered cigarette, so as I
15 don't pick on one company or another here -- that
16 the crap that you inhale from that deposits very
17 early because it's large particles.

18 When you filter it, the smaller particles
19 can get further out into the lung. And so you would
20 expect, then, to see a switch from squamous to adeno
21 just based on the filter -- on the particle size
22 going out.

23 So with respect to causation and the type
24 of pattern we're seeing, that is another point I
25 will make either here today, as I've just done, or

1 under testimony.

2 Q. I only do so-so reading upside down.

3 A. Yes. It's -- I can read upside down.

4 It's okay.

5 Q. You said this first area -- and I don't
6 want to make any marks on your diagram.

7 A. Yes.

8 Q. How did you identify that first area?

9 A. I called that the zone of squamous
10 differentiation. Squamous is -- are flat cells.
11 Your skin -- the early part of your upper airway is
12 all squamous, and that is a protective coat, to
13 protect you from viruses and various things getting
14 into your body.

15 So when that -- and when that is
16 irritated, it gets more squamous. If you irritate
17 your hand, you'll get a callous or a -- in that
18 area. It thickens, and that's the response of this
19 area.

20 Further down, when you irritate this
21 area, it makes more secretions at first. And then,
22 when it becomes malignant, it forms a glandular
23 carcinoma or an adenocarcinoma.

24 Further down here, in the airways
25 where we actually do the breathing itself, in this

1 so-called respiratory zone, these cells -- what they
2 secrete is a product called surfactant, which is
3 what infants with respiratory distress syndrome
4 have, and --

5 For example, if I took and I blew bubbles
6 into this water, those bubbles would not persist.
7 If I put soap in there and I blew bubbles into
8 there, those bubbles would persist. That's an issue
9 of surface tension. And surfactant is a surface-
10 tension agent; like soap is in this particular
11 instance. So, absent surfactant, when you expand
12 your lung and then collapse it, instead of coming
13 down smoothly, it collapses like that (indicating).
14 That's what happens to infants with respiratory
15 distress. So now we blow surfactant down there.

16 Well, as these cells get irritated
17 and become malignant, sometimes they'll produce
18 absolutely voluminous quantities of this clear
19 fluid, and people present with what's called
20 bronchorrhea. They just keep coughing up clear
21 mucus constantly with that, and that's how we've
22 been able to distinguish the various differences.

23 There are immunohistochemical and
24 molecular markers that differentiate these
25 areas as well, and I think now a pretty good

1 conceptualization by basic scientists in this area
2 of a necessity to understand these differences --
3 and there are gradations between them -- this is not
4 a sharp line between them -- as you talk about the
5 disease and its causation and why we see different
6 patterns in these.

7 Q. You use the term "irritation" in the
8 various systems. Are you using that word synonymous
9 with the mutations of the cells?

10 A. No. No. If you put a chemical onto any
11 surface, whether it's your airways or your skin or
12 anyplace else, it will do two things. If it has the
13 capacity to mutate, it will cause a mutation. That
14 mutation is not accompanied by an inflammatory
15 response, okay?

16 Now, if a compound can cause an
17 inflammatory response -- that means your body says,
18 "This is irritating. We're going to put pus cells
19 and other things in there" -- histamine, get some
20 fluid in there, you know, get rid of it, dilute
21 it out of there -- that's called its ability to
22 irritate or to cause an inflammatory response.
23 They're frequently linked but not always. I mean,
24 you know, bee stings are inflammatory, but they
25 don't cause cancer and vice versa. There are some

1 things that are totally noninflammatory but are
2 malignant. It has nothing to do with cigarette
3 smoking, either, but there are -- in cigarettes
4 they are -- they run together because it is both
5 irritating and mutating.

6 Q. Okay. Would you draw "Number 2" at the
7 bottom of that page so I'll know that that was the
8 second drawing.

9 A. Surely.

10 Q. And do you still have the first drawing
11 that you did?

12 A. I believe I do.

13 Q. If you would put a "1" at the bottom
14 corner of that one.

15 A. Surely.

16 MS. ECKELS: And I'd like to have both of
17 these marked as an exhibit to your deposition.

18 THE WITNESS: That's fine with me. Do
19 you want me to hold them up -- is that 2 as
20 well? But I'll give them as exhibits. That's
21 fine.

22 THE VIDEOGRAPHER: Thank you.

23 THE WITNESS: You're welcome.

24 (The documents were marked as Ruckdeschel
25 Exhibit Numbers 1 and 2 for identification.)

1 BY MS. ECKELS:

2 Q. With that additional testimony, have you
3 completely explained to me your opinions regarding
4 the causal connection, if any, between cigarette
5 smoking and lung cancer?

6 A. To the best of my memory today, yes.

7 Q. Okay. Do you have opinions, Doctor,
8 regarding a causal connection between cigarette
9 smoking and any other types of cancer?

10 A. Yes, I do.

11 Q. Would you list those cancers for me
12 and then we'll discuss the opinions for each?

13 A. Yes. The opinions will be the same for
14 each, and so I'll -- I'll go into it. It is my
15 understanding that -- and, again, these are not
16 areas that I follow on a day-to-day basis, but only
17 in the course of many meetings and reviews.

18 Most clearly, the whole array of
19 cancers called head-and-neck cancers or upper
20 aerodigestive cancers -- and by those I mean the
21 tongue, the buccal -- the inside of the cheek -- the
22 tonsils, the pharynx, the larynx, that whole area of
23 the upper airways here, that those are clearly
24 cigarette-related or smoking-related diseases.

25 That esophageal cancer has some

1 relationship to it. Again, that's -- you actually
2 inhale a fair amount of air and smoke along with it.
3 Bladder cancer and pancreatic cancer are the others
4 that I'm most associated -- most familiar with them.
5 I'm sure there are probably others, but those are
6 the ones I'm most comfortable with, and it's really
7 the same issue. Each of those organ systems --
8 I'm sorry. It's a little bit different issue.

9 Head-and-neck cancers are exactly like
10 lung. It's a direct toxic exposure to that tissue
11 where the balance of irritation and mutation --
12 those damages occur in the tissue, and the same set
13 of -- even though they may differ in their details,
14 it's the same summation of genetic and other
15 occupational exposures that lead to it; and, in
16 particular, in head-and-neck cancer, alcohol usage
17 -- heavy alcohol usage, along with tobacco, seems to
18 be a big problem in head-and-neck cancer. It seems
19 to contribute as well, and there's a little bit less
20 on occupational exposures in that area.

21 The other cancer -- and esophageal
22 cancer, to the extent it's related, would be the
23 same. Cancers like bladder cancer -- it would
24 appear that, as some of these compounds are taken
25 into the body or absorbed through the lungs, the

1 body has to get rid of them.

2 Now, the body can absorb through the skin
3 or through the respiratory tract -- or the GI tract,
4 if you eat it -- can absorb what I will call
5 hydrocarbons or organic substances. Those are
6 things that are soluble in alcohol, for example, or
7 in any other organic compound.

8 Now, your body does not like organic
9 compounds floating around in it. And so one of the
10 major detoxifying systems you have -- the whole
11 p450 system, et cetera, and a whole array of other
12 detoxifying enzymes -- are immediately trying to
13 convert any organic compound in your body into a
14 water-based compound, something that is soluble in
15 water.

16 For example, oil and water don't mix.
17 In vinegar, you -- or in a salad dressing, you shake
18 it up, okay, and you get the bubbles of one and the
19 other. You leave it long enough and they settle out
20 again, okay?

21 So what your body is saying is, we don't
22 -- we can't have things floating around like that.
23 So we have to convert that oil-based substance into
24 a water-soluble substance so it stays in. That's
25 how you detoxify everything, every drug, every

1 chemical. Anything you absorb is done that way.

2 And so what appears to happen is that you
3 take that in; it gets absorbed; goes to the kidney
4 and the blood flow, and that's one of the places
5 where -- because that's how you get rid of it, is
6 either through the kidney or through the bile duct.
7 That's how you take organic compounds; convert them
8 to water-soluble compounds; and get them out of the
9 body. That's -- that's how you do it. There's --
10 or in the stool. I guess that's the other place you
11 could do it.

12 But -- so I would look at bladder cancer
13 as something where these compounds are absorbed.
14 They're turned into water-soluble. They're released
15 through the kidneys into the urine, and it sits in
16 the bladder for one hour, two hours, however long we
17 can go between urinating, and that's how I -- where
18 I feel that is the relationship to it.

19 But that relationship -- that's only the
20 means of exposure. The rest of it's identical.
21 Every cancer is a summation of various pre-existing
22 genetic defects from when you're born, plus the ones
23 you accumulate over time, and I'm sure there were
24 other toxins that we absorb and other chemicals that
25 we absorb that affect the bladder and that the

1 smoking may be additive to.

2 It can happen without that. You can
3 certainly have bladder cancers without being a
4 smoker in the -- with other occupational exposures,
5 but it's one of the things that contribute. I think
6 they're all in that same pattern.

7 Q. When you talk about these compounds that
8 the body has to convert into being something
9 water-soluble, and at that point it becomes exposed
10 to bladder -- can you identify what compound you
11 were just talking about, Doctor?

12 A. Any organic compound.

13 Q. Can you identify for me which of these
14 compounds are contained within tobacco products?

15 A. Sure. A major majority of benzopyrenes,
16 diol-epoxides, a whole series of the compounds in
17 there. Everything that makes up tars, okay, is an
18 organic compound that needs to be converted to a
19 water-soluble compound to get it out of the body.

20 Q. Do you believe -- or is it your opinion
21 that there is a more remote causal connection
22 between cancers of the bladder and cigarette smoking
23 than there is, in your opinion, between lung cancer
24 and cigarette smoking?

25 MR. SCHLESINGER: Objection as to form.

1 A. I believe that the pathways are
2 identical. It's a question of exposure. When you
3 inhale a cigarette, you're putting it directly on
4 the upper airways and the lungs. When you absorb
5 it in the bloodstream, some goes out the bile; some
6 goes out the stool; and some goes out the urine.
7 And so the amount that gets elsewhere is less.

8 I think if you gave the same amount of
9 material into the bladder that goes into the lungs,
10 you'd see the same rate of development of bladder
11 cancer as you do of lung cancer, but it just happens
12 that there's not as much. So I think the causality
13 -- the causal relationship is identical, but there's
14 a dose factor as to how much gets there.

15 Was I clear on that? I'm sorry if I'm
16 not.

17 Q. I think so. And given the nature of how
18 these compounds travel through the body, is the dose
19 or the potential dose that can be -- that can
20 interact with the bladder ever going to be equal to
21 that that interacts with the lung?

22 A. No, and that's because our body handles
23 them in different ways. You deposit some of it in
24 fat tissue. For example, if you're exposed to DDT,
25 I can tell you it will go to your fat tissue. It'll

1 go to breast milk, if you have that; it'll be stored
2 in those cells. Some of it will be excreted through
3 your kidneys, some through the liver; some will go
4 out in the stool. Some you'll cough up in the
5 process of it.

6 So you get different dosages, depend
7 on that. It's impossible to get 100 percent of
8 anything inhaled through the system into the
9 bladder.

10 Q. In your opinion, are there other causes
11 for bladder and pancreatic cancer, other than
12 exposure to organic compounds?

13 A. Yes.

14 Q. What are the other causes for those type
15 of cancers?

16 A. I think those are more specific,
17 especially in pancreatic, specific changes in
18 genetics, specific gene deficits in that. And,
19 again, I don't follow that as closely, but I think
20 the bladder, for an example, is -- any number of
21 things can cause those changes within the bladder.
22 So, again, it depends on where you get those
23 compounds there.

24 Again, the -- whatever the sequence of
25 genes are for pancreas and bladder cancer that we

1 don't understand as well -- they're not as
2 well-studied as we have it for colon, breast and
3 lung -- there's some sequence and there's some
4 summation of things you're born with and some things
5 you accumulate over life that leads to a malignant
6 change in there.

7 Are all of them due to organic chemicals?
8 Probably not. Are some of them due to other
9 illnesses? Are some of them due to changes you're
10 born with? Undoubtedly. What they are, I don't
11 think we have a good understanding. I certainly
12 don't have as thorough an understanding. My
13 understanding is the epidemiologic data, that these
14 are tied together, and then some of the scientific
15 data. But, again, that's not the area that I follow
16 every day.

17 Q. Expanding the question -- and this may be
18 the same answer. But expanding the question to
19 encompass things other than organic compounds, are
20 there other commonly accepted causes for the bladder
21 and pancreatic cancer?

22 A. I would give the same answer. They're
23 there, but I don't -- I'm not totally familiar with
24 all of them.

25 Q. Okay. Given that there are other causes,

1 do you have any understanding of what percentage of
2 bladder or pancreatic cancers are attributable to
3 cigarette smoking versus other causes?

4 A. I've seen that data. I just don't
5 remember it. Again, it's not something I do every
6 day. I wasn't -- I didn't go back and review it in
7 preparation for this. I just don't remember it.

8 Q. And I don't want to hold you to any
9 specific percentage; but in your recollection, was
10 it a truly significant number, over half, over 25
11 percent, or do you even remember a range?

12 A. I just -- I don't remember. I don't even
13 remember the range. I remember it being
14 significant, but I don't remember the range.

15 Q. Okay. I have a series -- a similar
16 series of questions regarding the head, neck and
17 esophageal cancer.

18 Are there other, in your opinion, causes
19 -- accepted causes of cancer other than an exposure
20 to tobacco?

21 A. The esophagus, like the lung -- let me
22 address that one first -- is an organ with different
23 parts to it. We think of it as a tube that connects
24 the mouth to the stomach, and it's relatively a
25 straightforward function of just moving food in

1 an organized fashion to the stomach.

2 However, the esophagus is, again,
3 composed of squamous cells up near the top and down
4 near the base as it goes into the stomach. There is
5 a tendency, especially with irritation, for it to
6 become more adenomatous, what we call a Barrett's
7 esophagus, over time, and those are two very
8 different kinds of cancer that arise in the
9 esophagus.

10 The Barrett's esophagus has a whole
11 series of early molecular changes described for it.
12 It seems to be occurring with increased frequency in
13 middle-aged men with indigestion; totally different
14 set of causal factors or -- not so much causal as
15 supplementary factors as -- or perhaps causal --
16 as cancers of the upper esophagus, which are more
17 likely to be related to smoking because of the
18 inhalation of smoke.

19 That aside, the issues in the head and
20 neck are really -- I mean, I would go back to the
21 same discussion on lung cancer. Here, though, the
22 cofactors -- the other things that come into play
23 are not so much asbestos and nickel and radon as
24 they are alcohol, and in selected instances where
25 there are snuff chewers, et cetera, people who keep

1 that stuff -- tobacco chewers keep that stuff in the
2 side, so the same products; it's just they're not
3 in inhaled form. They're in liquid form.

4 Q. And, similarly, are you aware of any --
5 or do you know the statistical breakdown of the
6 percentage of head and neck and/or esophageal cancer
7 cases which are attributable to cigarette smoking
8 versus other causes?

9 A. Yeah. I don't remember it in esophagus.
10 In head and neck, it's -- it's way up. It's over 90
11 percent, again. It's an uncommon disease, an almost
12 unheard-of disease without smoking or tobacco
13 chewing.

14 Q. Have you listed or explained to me,
15 Doctor, all of the other cancers which, in your
16 opinion, have a causal connection to smoking?

17 A. You know, with the proviso that my memory
18 isn't what it used to be, those are the ones I
19 remember offhand today.

20 Q. Okay. Alternately, are there certain
21 cancers which, in your opinion, do not have a causal
22 connection to smoking?

23 A. I think that there are cancers, such as
24 sarcomas and lymph node cancers, that -- such as
25 Hodgkin's disease -- that I have never come across

1 evidence that they are in any way related to
2 smoking, but it's possible I'm wrong and I just --
3 I've never -- I've never been exposed to any
4 information to that -- to that end.

5 Q. What about breast cancer?

6 A. I -- I can't remember all the data on
7 that. I -- you know, I have heard some people
8 discuss the issue of whether there is a relationship
9 and whether it's one of the things that contributes,
10 but I really don't remember it in enough detail to
11 comment on it.

12 Q. What about colon cancer?

13 A. Same. Same as the breast cancer answer.
14 I'm sorry.

15 Q. Would it be correct to say, then, Doctor,
16 you have no opinion as to whether or not there is a
17 causal connection between breast or colon cancer in
18 cigarette smoking?

19 A. I have no memory as to whether the data
20 that I've seen on that would establish, in my own
21 repertoire of opinions, a causal relationship. If I
22 go back and prepare that and read through that area,
23 that will probably shake my memory, if there is such
24 information, but I didn't do that in preparation for
25 today.

1 Q. In discussing the constituents or the
2 various compounds within tobacco that you believe
3 relate to genetic mutations, are there certain
4 compounds or constituents that you associate with
5 certain types of cancers?

6 A. The -- the list of compounds in tobacco
7 smokers is as long as this table, so -- the list of
8 cancers is almost as long, down there. And I
9 cannot, as I sit here today, draw specific compounds
10 to specific cancers. It's the -- the whole ball of
11 wax that's in tobacco smoke, and I'm sure there are
12 people who follow this more closely that can point
13 to specific compounds with specific defects, but I
14 don't follow that on a day-to-day basis.

15 MS. ECKELS: I'm being told we're out of
16 tape, so I think we've got to go off.

17 THE VIDEOGRAPHER: The time is 3:25.
18 This is the end of the second tape of the
19 deposition of Dr. Ruckdeschel.

20 (There was a recess from 3:25 p.m. until
21 3:35 p.m.)

22 THE VIDEOGRAPHER: It's 3:35. This
23 is the third tape of the deposition of
24 Dr. Ruckdeschel.

25 THE WITNESS: Very good. It took till

1 the third tape, but we got the pronunciation
2 right.

3 BY MS. ECKELS:

4 Q. Doctor, have you now had an opportunity
5 to explain to me your opinions regarding causation
6 between cigarette smoking and various types of
7 cancer?

8 A. Yes, I believe so.

9 Q. Do you have any other opinions regarding
10 a causal connection between cigarette smoking and
11 any other types of cancer that you've yet to explain
12 to me?

13 A. Not that I'm -- not that I remember
14 today.

15 Q. Okay. I'd like to move on to another
16 area that you have indicated that you are an expert
17 and which you have expert opinions, and that is the
18 treatment of a cancer patient.

19 A. (Witness nods head.)

20 Q. What -- and, again, I'll start off
21 with focusing just on lung cancer and then move
22 to others. What is the -- or what are the various
23 types of treatment for lung cancer?

24 A. The -- and if we were -- if I had known
25 this, I would just have brought the picture of it.

1 There's a very complex algorithm, a series of boxes.
2 You start here with a suspicion of this. You
3 confirm this. If it's this, you do this. If it's
4 that, you do that, but within -- within those
5 bounds.

6 The first thing you're doing is looking
7 to see -- is if the patient is surgically resectable
8 or not. If they can have surgery and the chances of
9 cure from that surgery are in the 50 percent or
10 better range, then you clearly move towards surgery.
11 Depending on the staging findings, you may have a
12 sense or clear data that the chances -- that the
13 patient can have a resection, but the chances of
14 recurrence are quite high. And so you look to add
15 either radiation therapy or chemotherapy to that,
16 either before or after that. All of those have been
17 studied or are currently under study.

18 And if the disease is a little bit more
19 advanced so that it is extensive within the chest,
20 but you don't find -- even though you know,
21 statistically, that there is microscopic disease
22 elsewhere, but you can't see it because of the
23 limitations of our instruments. For example, to see
24 something on an x-ray or a scan, it has to be as big
25 as my thumbnail. It has to be a centimeter in size.

1 Well, that's a few billion cancer cells.
2 So 10,000 cancer cells in your liver or brain,
3 someplace else, there's no test -- no image we have
4 that can even vaguely pick them up. But I know
5 they're there because I know 90 percent of people
6 with this stage wind up with metastatic disease.

7 So if I see that, and I see it extensive
8 in the chest so that the surgeon cannot safely
9 remove the cancer without taking out vital organs,
10 but I don't find it elsewhere on the testing I do,
11 then I combine chemotherapy and radiation.

12 If it is extended beyond the chest,
13 elsewhere in the body, I use chemotherapy. I will
14 go back and I will use radiation therapy to palliate
15 other areas that it shows up where it causes pain or
16 pressure on a particular organ. But those are all
17 palliative procedures. Those -- the others are the
18 ones that I would use in an attempt to cure or to
19 prolong life, if I can't cure.

20 Q. And I believe I understand you, but for
21 the benefit of others, explain what you refer to
22 when you use the term "palliative procedures."

23 A. Yes. A palliative procedure, in the way
24 I'm using the term, is a procedure that's meant --
25 really, we try to balance what's -- when we talk

1 about the quality and the quantity of life. So when
2 I talk about an active treatment, I'm talking about
3 something where I'm making an attempt to increase
4 the quantity of life that you have remaining. I
5 would love to cure you, but if I can't cure you, if
6 I can get you from a one-year expected survival to
7 two or three, or from three months to one year, all
8 of those are attempts at active treatment.

9 Palliative treatment is the treatment I
10 have has no expectation that it will make you live
11 one day longer, but whatever days you have to live
12 will be spent far more comfortable and far more
13 productive than not, than if I didn't treat that
14 problem.

15 Q. What -- or how do you determine which of
16 these treatments -- or which combination of them you
17 use in a particular patient?

18 A. What it is, where it is. And then, from
19 that grid of what its stage is and what the cell
20 type is, there are usually an array of treatments
21 that are available. By 25 years of it, by having
22 participated and led many of the national studies in
23 this area, by writing the text -- editing the
24 textbook in the area, et cetera, et cetera, I have a
25 pretty good handle on which things are either proven

1 or nearly conclusive, versus those that are pretty
2 speculative, versus those that are under study,
3 versus those that just don't plain work -- plain
4 don't work, and so that's just on experience, and I
5 choose it from that.

6 Because I'm not a research center, I
7 always ask -- the first thing, when I determine the
8 stage of a patient, is: Is there a study available
9 for this patient? If it -- will we -- do we have a
10 study so that by -- in treating this patient, I will
11 actually learn something so they will become --
12 their outcome will become part of a greater body of
13 knowledge as opposed to just being treated and it
14 goes into my memory bank somewhere.

15 Q. And within your field, are there
16 generally accepted protocols of treatment for
17 various types of cancer?

18 A. Yes. There are extensive treatment
19 algorithms, so-called guidelines, clinical
20 guidelines. There are numerous reports of them now.
21 The National Cancer Center's network has published
22 them. We've published seven -- we've prepared 70 of
23 them and published many of them. Last year at the
24 American Society of Clinical Oncology, we presented
25 and, hence, published, both here and in Argentina,

1 where they picked that up in their literature, an
2 algorithm for how to go through this thought of
3 managing lung cancer.

4 So, yes, they're out there. They're
5 complex but they're there.

6 Q. And is Moffitt currently involved in any
7 clinical trials where they are experimenting or
8 trying different types of combinations other than
9 the accepted protocols?

10 A. Yes.

11 Q. Okay.

12 A. Numerous ones.

13 Q. And that's not an unusual event, is it?

14 A. No.

15 Q. Okay. And that's how -- is it correct to
16 say that that's how new protocols are formulated and
17 new recipes, if you will, are found to treat various
18 types of cancer?

19 A. That's correct, and that's uniform across
20 all forms of cancer. Test whatever you do now
21 against whatever you think might be better. It's
22 the ultimate -- ultimate litmus test.

23 Q. Do you develop or utilize a treatment
24 plan for a lung cancer patient that does or did have
25 a smoking history different than one that you would

1 use for a lung cancer patient who did not have a
2 smcking history?

3 A. Slightly, yes.

4 Q. In what way would they differ?

5 A. Again, the -- the ability -- if I remove
6 lung tissue through surgery, either take out the
7 whole lung or a portion of the lung, I will have, by
8 dint of doing that, reduced the amount of pulmonary
9 tissue they have to breathe on.

10 Now, when you're -- when you're young and
11 healthy, you've probably got a tennis court full of
12 surface area. If you peeled apart all those little
13 air sacs and spread them out on the floor, you'd
14 have a tennis court.

15 You probably don't need much more than
16 this table size to really -- to breathe on, to walk
17 around the room and stuff. You're not going to run
18 any marathons on it, but that's about all you'd need
19 to do that.

20 And so, if I have someone who has never
21 smoked, then I presume that the chances of them
22 having a significant breathing problem, so that they
23 could not tolerate surgery, are very low. And if
24 they have no pulmonary symptoms and they've not been
25 a smoker and they've got something in their lung

1 that we're going to operate on, we may go ahead and
2- do that without checking pulmonary functions.

3 Whereas, on the other hand, if they're a
4 smoker, I need to know what their pulmonary function
5 is before I do that.

6 Radiation does the same thing as surgery.
7 It just takes a couple of months. You radiate an
8 area of lung and it's fine for a few weeks, but
9 within a few months that area is gone, and you've --
10 you've essentially destroyed it as a functioning
11 air/gas exchange organ.

12 And so, I have to know, if I'm going
13 to radiate the left upper lung, that that's not a
14 significant portion of what they're breathing on.
15 So if this -- this is two tables here. If one of
16 these tables was your left upper lobe, and I either
17 removed that surgically or killed it with radiation
18 therapy, and this was all you had to breathe on,
19 you'd be in very deep weeds, indeed, and on oxygen
20 and confined to wheelchair or bed and not living
21 a very productive existence.

22 Q. Given that I have certain time
23 constraints --

24 A. Yes.

25 Q. -- to discuss things with you here today,

1 Doctor, is it possible, in a fairly shorthand
2 fashion, to describe the different treatments for
3 lung cancer, given the various cell types, or is
4 that a truly complicated discussion that would take
5 a lengthy period of time?

6 A. No. They're really the same. You treat
7 local disease -- the only difference between them
8 now is that we don't use surgery at all in the small
9 cell cancers. We use it whenever we can in the
10 non-small cell cancers.

11 We use radiation and chemotherapy
12 virtually under the same guidelines in both
13 diseases, for various permutations of local disease
14 or locally advanced disease, and we use chemotherapy
15 for advanced disease.

16 The chemos actually were fairly similar
17 until recently, when we got available some new drugs
18 for non-small cell. Those are just now being tested
19 in small cell. And so actually it's been commented
20 on in several national meetings in the last year.
21 They've really come together, and the only real
22 substantive difference still remains the fact that
23 surgery is not a useful -- useful treatment for most
24 patients with small cell. There's a little subset
25 of tiny nodules that we don't know are small cell,

1 but that's about it other than that.

2 Q. And I believe you touched on this
3 earlier, but now that we're on the subject of actual
4 treatment, is there a difference in the course of
5 treatment prescribed for a lung cancer patient
6 depending on whether it was a primary lung versus
7 metastasis?

8 A. It's totally different.

9 Q. Okay. And is it correct to say that that
10 difference relates to what type of chemotherapy
11 would be most successful on the primary organ site?

12 A. It's what type of treatment would make
13 the most sense. People think of colon cancer that
14 spreads to the lung as lung cancer. They do that
15 mistakenly. It's colon cancer in a different spot.

16 The -- if it's -- again, the discussion I
17 had about the length of the interval and the growth
18 rate of the tumor -- if it's grown very slowly and
19 there are only a few nodules, we may we use surgery
20 as opposed to chemotherapy. So with those in mind,
21 often -- most of the time with metastatic disease,
22 it is a difference in chemotherapy, but there are
23 situations where we would use other -- other
24 modalities to do that, and they're very different.

25 Q. Other than the need for pulmonary

1 function testing and pulmonary function knowledge,
2 which you just described a moment ago, are there any
3 other ways in which you would have a treatment for a
4 lung cancer patient with a smoking history that
5 would differ from a lung cancer patient without a
6 smoking history?

7 A. Cardiac evaluation, for all the same
8 reasons. If you've got just enough cardiac -- it's
9 the other half of breathing, besides the surface
10 area of lung, is the capacity of the heart to pump
11 the blood through the lung. And if you don't have
12 enough and you take that out of balance so that the
13 -- if what we had in pulmonary function was the size
14 of this room -- not the size of the table -- we say,
15 "Okay. Well, there's probably enough pulmonary
16 function there for normal activity," but your heart
17 needed every bit of that oxygen because it had
18 narrowed coronary arteries, et cetera, and you take
19 it down to the size of this table, that isn't going
20 to work, either, because your heart now won't get
21 enough oxygen, so --

22 I mean, those are -- and there's an
23 interplay between those, and it's complex, but
24 that's the fundamentals of it. So cardiac function
25 is something we clearly watch whenever we think it's

1 suspiciously abnormal.

2 Q. Any other differences in the treatment
3 between a lung cancer patient with a smoking history
4 and one that does not, other than the need for the
5 additional pulmonary function knowledge and a
6 cardiac evaluation?

7 A. I think the only other difference is
8 that it -- it's now clearly been demonstrated that
9 people with either small cell or non-small cell who
10 continue to smoke have an increased risk of second
11 cancers developing and also have more -- and
12 particularly in small cell -- have more infections
13 and live shorter. They don't respond as well or
14 they don't live as long on therapy as people who
15 don't continue to smoke during that.

16 So I would -- I would say that a smoker,
17 I'm going to be working with them on smoking
18 cessation to the best that they're able to do that.

19 Q. Do you have any other opinions, Doctor,
20 regarding the treatment of a lung cancer patient and
21 how that would be affected by a smoking history?

22 A. No.

23 Q. Okay. Do you have any opinions, Doctor,
24 regarding the course of treatment for a patient with
25 a smoking history versus a patient without a smoking

1 history for other types of cancer other than lung
2 cancer?

3 A. Only to the extent that any patient who
4 has particularly poor pulmonary or cardiac function,
5 who has to undergo surgery, is at increased risk.
6 We all -- I mean, all of us in the room, to varying
7 degrees, even if we had to have our appendix removed
8 today, have a tiny risk of some catastrophe
9 befalling us due to being anesthetized and to all
10 the physiologic changes that go on with surgery
11 and blood clots and all the other things, like
12 arrhythmias and irregular heartbeats and et cetera.

13 Those risks go up dramatically in
14 a smoker, of postoperative infections, cardiac
15 irregularities, et cetera. And so to the degree
16 that I had to perform or recommend surgery for any
17 other cancer, if the patient was a smoker with
18 severe emphysema or COPD or severe coronary artery
19 disease, that would very much influence how I
20 treated that patient.

21 Q. Any other opinions, Doctor, regarding
22 treatment of a non-lung cancer patient as it relates
23 to cigarettes or cigarette smoking?

24 A. Not at the moment, no. Not that I
25 remember any.

1 Q. Okay. One of the other areas in which
2 you have testified that you believe you are an
3 expert and have expert opinions is in the management
4 of a cancer patient. Is that correct?

5 I believe that's one of the ones you
6 listed for me, yet you frown, so I believe that's
7 one of the ones you listed earlier.

8 A. "Management" is a term we use for
9 clinical management. Do you mean in the financial
10 and economic analysis of that or what meaning do you
11 have for "management" here?

12 Q. I'm referring to the clinical management.

13 A. Clinical management, okay.

14 Q. And we'll get to the financial
15 management --

16 A. Okay.

17 Q. -- end of it later, and I'll be specific
18 with you at that time, but I appreciate your
19 pointing that out.

20 What is -- and this may vary with the
21 various stages of cancer, I understand. But can you
22 describe the various types of management for a
23 cancer patient?

24 A. Management and clinical treatment are
25 identical. There's absolutely no difference. You

1 sort out what stage they are and you manage them or
2 treat them. They're identical terms. They're
3 interchangeable, in that context that you've just
4 stated. So whatever answers I gave would be
5 identical down to that.

6 Q. What about, I guess, the location
7 of treatment or management? Of the lung cancer
8 patients which you or your group treat, do you have
9 a feel for what percentage of them are ambulatory
10 and are therefore being treated or managed on an
11 outpatient basis?

12 A. Yes.

13 Q. What would that be?

14 A. I would say 80 -- 80 percent of our
15 patients are treated almost exclusively on an
16 outpatient basis.

17 Q. How would you describe the location of
18 the treatment or management for the other 20
19 percent?

20 A. They require hospitalization at a point
21 in their course; usually, for surgery; occasionally,
22 for some complications of therapy.

23 Q. At any given time, are there a percentage
24 of your patients that are at a hospice?

25 A. Oh, yes.

1 Q. Do you have a feel for what that
2 percentage would be?

3 A. Well, as a medical oncologist who does
4 lung, I probably have 15 or -- well, 10 or 15
5 percent of my patients in hospice at any given time.
6 It's obviously a very fluid number because they're
7 going out the other end of hospice on a regular
8 basis.

9 Q. Do you know if hospice is a reimbursable
10 expense under the Florida Medicaid?

11 A. I don't know that, offhand, come to think
12 of it. I believe it is. It's a Medicare benefit,
13 and so if someone -- if someone came in and did not
14 have funding or was on Medicaid, who was diagnosed
15 as having lung cancer, we would probably -- and who
16 was eligible -- we'd probably look towards
17 disability determination on them, which would be
18 automatic; and then setting in place their Medicare
19 benefits as well, if they were of that age, or
20 disability benefits, depending on that piece.

21 I just -- I'm almost sure it is because
22 we send Medicaid patients there, the same as we send
23 anybody else. I don't -- I don't even -- I make no
24 distinction.

25 There's a couple of really retarded HMOs

1 who don't cover hospice benefits; but other than
2 that, I'm not aware of anybody that excludes them.

3 Q. What about at-home care or therapy? Is
4 there a -- do you have a feel for what percentage,
5 if any, of your patients at any one time are
6 availing themselves or that you recommend they have
7 some sort of at-home care?

8 A. Well, in a certain -- first of all, all
9 hospice care, pretty much, is at-home care. There
10 are a fair number of patients who are on oxygen at
11 home, a few patients who take oral medications,
12 but it's maybe 5 percent of patients who have any
13 substantive component of that. I'm sorry -- in
14 whom that's the predominant form of their therapy.
15 Everybody has some proportion of home-care med;
16 everybody on medications of one sort or another.

17 Q. And is -- is it correct to say that the
18 at-home and/or hospice care is both for therapy and
19 for complications arising from therapy?

20 A. No. Hospice care is specifically in
21 place when you're not pursuing active therapy for
22 the disease. Hospice care is there solely for
23 palliative care, as we previously defined that.
24 And so they get very rightfully upset if I start
25 ordering chemotherapy and other aggressive

1 treatments in there. It's not consistent with the
2 concept of hospice, which is that active treatment
3 is done. It's now time to prepare for death and to
4 make the most of what time is available.

5 The other home care -- it varies. Some
6 people are -- have very slow-moving cancers. We
7 don't have an active treatment going on. We're just
8 treating symptoms. They can do that at home.

9 Others, what they do at home is an
10 integral part of their treatment, whether it's
11 physical therapy or respiratory therapy or
12 antibiotics or some chemotherapies that are given by
13 mouth.

14 Q. Within your practice and practice group,
15 do you know if there is a percentage, if any, of
16 your patients that are in a nursing home?

17 A. It's a very minute percentage.
18 Occasionally -- again, I told you in the beginning
19 that on our intake form, we identify the
20 availability of social supports. And one of those
21 questions has to do with, "Does anybody live with
22 you? Do you have people to help care for you?"

23 And so, I would say once every month or
24 two, I'll have a patient in whom they have no family
25 in the area or they're estranged from their family

1 or -- and the other family members can't get here
2 for various reasons, and the only place they can go
3 is to a nursing home. There's no way to send them
4 home. There's nobody to help care for them at home,
5 and so they would get to a nursing home, but that's
6 very, very uncommon.

7 Q. Expanding that same question beyond just
8 your practice at Moffitt, but rather your experience
9 on the whole with other facilities as well, would
10 you also agree that the percentage of individuals
11 who are lung cancer patients that are referred to
12 nursing homes is minute?

13 A. Yes. Mostly because the disease, by the
14 time they get to that phase, is going like a bat out
15 of hell, and the patients don't live long enough to
16 make it to a nursing home.

17 Q. Do you have any other opinions, Doctor,
18 that relate to the field or the area of management
19 -- I know you've told me that's basically identical
20 to treatment -- of a lung cancer patient as it
21 relates to any particular aspects, if they have a
22 smoking history?

23 A. No. Given that proviso of what we call
24 management or treatment, I don't -- I don't think
25 so.

1 Q. Okay. The same question but as to other
2 cancers outside of lung.

3 A. Same thing. Same thing.

4 Q. Okay. Another area that you have
5 expressed expertise and the fact that you have
6 opinions is the costs affiliated with the management
7 of cancer patients. Is it possible -- again, within
8 the confines of some of the time limitations we have
9 today -- to begin to outline or express for me what
10 the typical costs are?

11 A. With the proviso that this is extremely
12 rough and is conditioned by the time constraints we
13 have, and there are obviously far more nuances to
14 this. I think there's very good data nowadays --
15 much of it developed in Canada but a lot of it
16 developed in the states -- and data that each of us
17 who run institutions have to develop on a regular
18 basis.

19 We know the approximate cost -- somewhere
20 in the twenty to twenty-five thousand dollar range
21 -- of having a patient comes in who has primarily
22 surgical therapy. We add five or ten thousand
23 whenever we add radiation, and we add another ten or
24 twenty thousand whenever we add chemotherapy on sort
25 of an average course over a period of time. Those

1 numbers go up when you have newer drugs.

2 Taxol, for example, is several thousand
3 a treatment instead of several hundred for other
4 treatments. So you can -- you can get up there.

5 I don't have the figure in front of me,
6 but we could go through our decision support systems
7 at the Cancer Center -- I'm sure other centers can
8 do so as well -- to give you relatively specific
9 average costs for patients with lung cancer.

10 In fact, part of our business in dealing
11 with managed care companies is -- and the government
12 -- is to be able to very specifically know what our
13 costs are, so that if we offer a capitated or a
14 discounted price to the companies, that we can meet
15 that, that it's something we can possibly do.

16 Q. Are you also prepared, and do you feel
17 you have expertise in opining on the costs
18 affiliated with treating other kinds of cancer other
19 than lung?

20 A. Yes.

21 Q. What other types of cancer --

22 A. Virtually every one; because, as Director
23 of the Cancer Center, I see what those costs are.
24 And, fundamentally, what we're doing in that setting
25 is to look and say, "Where are the outliers? Are

1 there certain diseases, for which we've identified
2 benchmarks, that we're way over or way under? Are
3 there certain diseases that can be treated more
4 cheaply with the same or better outcomes and the
5 same or better quality of that care?" So we're
6 constantly looking for that across the whole array
7 of things that we do.

8 Q. Okay.

9 A. And, in fact, we've published extensively
10 on reducing length of stay for prostate surgery, the
11 whole business in the newspapers recently about the
12 lymph node mapping and breast cancer was developed
13 at our institution, so that breast cancer may, in
14 fact, become an outpatient disease in the future
15 without the need to do the lymph node surgery. That
16 was all developed at our place. So we do a lot of
17 looking at our costs.

18 Q. Is it really necessary to discuss costs
19 per type of cancer, or are the costs pretty much
20 generic whether it's bladder or pancreatic, colon?

21 A. No. They're very, very different.

22 Q, Okay.

23 A. Some diseases -- and, again, it's both
24 disease-specific and it is stage-specific, so that a
25 localized bladder cancer requires some installations

1 into the bladder on an outpatient basis. A
2 localized lung cancer requires thoracic surgery.
3 I mean, those are vastly different treatments in
4 both cost and complexity.

5 So, you know, again, within your time
6 constraints, there's lots of data on it. I'm
7 familiar with it. I'd be happy to opine, to the
8 best of my memory, any particular one you want, but
9 we could spend an awful lot of time tracking this
10 down.

11 Q. I understand, and I may come back to
12 that, if I have the opportunity, but I don't think
13 I'll be able to go into the various kinds with you
14 today.

15 But let me ask you this: Is it
16 understood, or is there a general understanding
17 within your field that certain types of cancer are
18 far more expensive to treat than others? And, if
19 so, which are they?

20 A. Well, I think the ones that are clearly
21 most expensive are the leukemics and any of the
22 diseases for which we're using high-dose therapy
23 with bone marrow transplantation. There's no
24 question that adds a level of complexity and cost to
25 their care that far outweighs whatever we do with

1 the standard combinations of chemotherapy, radiation
2 and surgery.

3 Q. You -- I'm going to kind of combine areas
4 with you for just a moment.

5 You mentioned earlier that you felt you
6 had a high degree of comfort, if you will,
7 discussing the operation and economics of the
8 Florida Medicaid system. Do you know, within the
9 Florida Medicaid population, what the costs of
10 treating various kinds of cancer are?

11 A. I do know that. I can't recite it for
12 you. I've seen it. I'm familiar with that data.
13 I just -- I mean, I can't remember it offhand to
14 give it to you; but, yes, I've seen that --

15 Q. Okay.

16 A. -- and discussed it with the state
17 Medicaid system. We've been negotiating with them,
18 trying to find a way to make sure these patients
19 don't get lost in between this current shift into
20 Medicaid HMOs, which is particularly problematic for
21 patients with cancer.

22 Q. Well, without getting into -- since you
23 don't have recall -- without getting into specific
24 figures or numbers, do you recall what types of
25 cancer are the most expensive or is costing the

1 Florida Medicaid system the most amount of money?

2 A. Well, that's two very -- very different
3 questions. The most expensive are the same as they
4 for non-Medicaid patients.

5 The converse of that -- the other half of
6 your question is: Which costs Medicaid more? Well,
7 the ones that cost more are the ones that are far
8 more common; and, of course, that becomes lung
9 cancer, breast cancer, because those are -- and
10 prostate cancer. Those are, far and away, the most
11 common diseases. So if a lung cancer costs \$20,000
12 to treat, and I treat a thousand of them, and a bone
13 marrow transplant is a hundred thousand dollars to
14 treat, but I only do two of them, the bone marrow
15 transplant was more expensive individually, but
16 the cost to the Medicaid system was there for lung
17 cancer or colon cancer, whichever the one is.

18 Q. Do you know, Doctor, if there is
19 statistical data or a breakdown, within the Florida
20 Medicaid population, of those who are smokers and
21 those who are nonsmokers?

22 A. I presume it's there, but I just don't
23 remember. I'm sure we have that data somewhere, but
24 I just -- I don't remember it.

25 Q. Do you have an opinion, Doctor, as to

1 what percentage of money spent for the health care
2 of the Florida Medicaid population is attributable
3 to smoking and which is not?

4 A. Oh. Yes, I do, but I -- and I've seen
5 those figures, but I don't -- I don't remember them
6 offhand.

7 There is a -- and I've seen -- and
8 I just don't remember the specifics of it. The
9 tobacco-related cancers and then the proportion of
10 pulmonary and cardiac disease that is -- is related,
11 and I've seen that broken out someplace, but I just
12 don't remember the date offhand. Actually, I think
13 there is pretty good data on that.

14 I'm sure there are others who can regale
15 you with the details of that, but --

16 Q. Do you know how -- I mean, you discussed
17 with me earlier today how you determined which types
18 of cancer are tobacco-related and which are not. Do
19 you know how the Florida Medicaid system makes that
20 determination?

21 A. Same way.

22 Q. Do you know if that --

23 A. They would call me. I mean, they
24 would call -- if they were interested in making
25 that distinction on a regular basis or on an ad hoc

1 basis, they would put together a panel of people
2 that would include me. And we'd sit down and say,
3 "These are the ones that look smoking-related.
4 Here's the proportion that we think is there.
5 Here's our best estimate of that."

6 We'd -- the state has pretty extensive
7 resources in epidemiology, both within the state
8 health department and within the universities for
9 statistics, and then the clinical people who can put
10 that together. My presumption is somewhere in this
11 litigation, that that's already been done. I just
12 haven't seen the final pieces of it.

13 Q. Okay. You presume that's been done,
14 but are you aware of any particular panel or group
15 that's actually done that?

16 A. No.

17 Q. On the paperwork or the standard forms
18 that Moffitt sends in for reimbursement of cancer
19 treatment, does it include the etiology of the
20 cancer?

21 A. In general, not. You know, some days
22 when I'm -- when we discuss it as an intellectual
23 exercise, there's broad agreement among all of us,
24 as specialists, that when people die of COPD or die
25 of lung cancer, that we should be putting, on the

1 autopsy -- on the death certificate "Smoking
2 Addiction" or some other discussion of their smoking
3 history so that that flags up. But, in practice, we
4 don't do that because there are so many things that
5 can go on there. Smoking is one of them. It's
6 presumed for certain of them.

7 We're busy; these things pop on our desk
8 in an odd moment and we sign it, and we put down
9 "They died of lung cancer; they died of heart
10 disease," or whatever the specifics are. But we
11 don't do it just because we're lazy, not because
12 it's the right thing to do.

13 Q. And given that that information
14 is not always available on data such as a death
15 certificate, does that make the epidemiological
16 studies based upon those certificates, then,
17 somewhat flexible?

18 MR. SCHLESINGER: Objection to the form
19 of the question.

20 A. Yeah, I think -- I think if a study was
21 based solely on death certificate data, that I would
22 always question that. People in the field always
23 question death-certificate-only data for the kinds
24 of things that are not on -- on there.

25 So when we talk about those in an

1 epidemiologic sense, it's because we have another
2 data source for that, whether that's data that was
3 collected clinically or is in the tumor registry.
4 I think the registries collect that, but I'm -- it
5 would come from another source.

6 Q. Would you agree with me, Doctor, that the
7 most definitive way to know an exact diagnosis is
8 typically the findings obtained through autopsy?

9 A. No. You know, the autopsy rates are so
10 low nowadays that we don't -- we don't see a whole
11 lot of them, and so -- in a day when we did not have
12 CAT scanning and magnetic resonance imaging and the
13 ability to do fine needle biopsies of virtually any
14 part of the body, the autopsy was the definitive
15 way, and often surprised us.

16 Nowadays, there's an occasional surprise.
17 The need for an autopsy is much less. We have so
18 many diagnostic things available to us that it is
19 very uncommon that we need an autopsy to sort out
20 what was wrong. It happens -- half a dozen patients
21 a year, but several hundred others for me
22 personally; several thousand others for us an
23 institution -- that we don't really need it. We've
24 got it absolutely locked solid what's wrong.

25 Q. Would you -- or are you of the opinion

1 that that is true for all medical facilities, or is
2 Moffitt, perhaps, slightly unique in that situation?

3 A. No. I think that's -- that's becoming
4 true. I think that's in a state of flux, okay. If
5 you -- if you want to go back and say, "What is the
6 absolutely definitive information," yes. I mean,
7 having autopsy information telling you where the
8 disease is, et cetera, that is the most definitive
9 way to do that, to have the information. But
10 because of those changes in medical practice and the
11 availability of far more sophisticated diagnostic
12 techniques, we rarely resort to it any more as a
13 means of solving the problem. That extends across
14 all different cancers.

15 Q. In those cancer cases where there is an
16 autopsy ultimately performed, is there still a
17 significant variance between what the death
18 certificate shows as a cause of death and what the
19 autopsy, actually, results -- or the findings are?

20 MR. SCHLESINGER: I'll object. We don't
21 know what you're talking about, Counselor. Are
22 you talking about bubonic plague? What do you
23 have in mind as far as the cause of death is
24 concerned? Broad, form. The question is
25 speculative. It is indefinite, and certainly

1 doesn't have a scientific basis that one could
2 draw any conclusions from.

3 If you could answer it, Doctor, you go
4 right ahead.

5 THE WITNESS: Can you repeat it?

6 MS. ECKELS: Sure. And I believe I
7 limited it to cancer patients.

8 BY MS. ECKELS:

9 Q. Do you -- or do you have an opinion
10 regarding the variance between what an autopsy --
11 what the autopsies of cancer patients ultimately
12 show as the cause of death versus what appears on
13 their death certificates?

14 A. Yes. The -- there's very little variance
15 on that. The number of patients in whom we put down
16 lung cancer as the cause of death and then perform
17 an autopsy and change that diagnosis of lung cancer,
18 I can think of two or three in a lifetime of doing
19 this, but that's an extremely rare situation.

20 What we use autopsies for and where
21 they help us is: Was there an unusual site of
22 metastatic disease in the brain or in the spinal
23 cord, or some unusual spot in the body, causing
24 symptoms that we couldn't find the source for
25 and that we couldn't treat very well; or, more

1 importantly, other problems, like infections, with
2 fungus or some unusual thing that we're not used to
3 seeing that confused us in terms of their clinical
4 situation?

5 Those are the things that autopsy
6 will frequently show us, something different than
7 we expected. That's where we find unexpected
8 tuberculosis or some other problem with a patient
9 and have to run back and get everybody tested for it
10 and stuff, but -- but those are the situations that
11 we see that are not -- if you see lung cancer on a
12 death certificate, it's -- 99.9999 percent of the
13 time it was lung cancer.

14 Q. Do you have any data or information
15 regarding the age or average age of the Florida
16 Medicaid population?

17 A. Oh, it's out there. I just don't
18 remember it. Actually, I think it's quite a bit
19 younger than the average age of populations because
20 there are a disproportionate number of children on
21 the Medicaid program in this state, but I don't -- I
22 don't remember it offhand.

23 Q. You just mentioned children within the
24 Medicaid program. Do you know what the breakdown is
25 between adolescents, adults in the Florida Medicaid

1 population?

2 A. I don't remember it offhand. I've seen
3 it, but I don't remember it.

4 Q. Do you have any other specific opinions,
5 Doctor, regarding the costs of treatment and
6 management of a lung cancer patient?

7 A. No, not that I remember right now.

8 Q. Did you have any other specific opinions
9 regarding the costs of treating patients other than
10 lung cancer patients as it relates to tobacco use?

11 A. No, same answer. Same answer.

12 Q. If any other opinions come to mind before
13 the end of the deposition, I'd appreciate if you'd
14 let me --

15 A. I wouldn't be --

16 Q. -- let me know.

17 A. As you know, I've been very shy about
18 giving my opinions, so I --

19 Q. I can tell. I believe we've probably
20 already covered this, Doctor, but I just want to
21 make sure. You mentioned earlier that, in a limited
22 sense, you do consider yourself an expert in the
23 area of surgery and have some opinions about
24 surgery.

25 A. Right.

1 Q. Is it correct to say that your opinions
2 relate to when surgery is indicated and when it's
3 not?

4 A. They go far beyond that; and those are,
5 again, uniquely related to my experience with the
6 Lung Cancer Study Group, to designing clinical
7 research studies involving surgery, to having
8 established the audit program for the Lung Cancer
9 Study Group and having been to every major thoracic
10 surgical center in the country and in Canada, and
11 having been through their cases and discussing how
12 to design the forms and how we were going to agree
13 or disagree on what was done and the nuances of
14 that. It's a relatively unique body of knowledge
15 about surgery and radio -- about the treatment of
16 this disease, just because of the role I've had in
17 clinical research.

18 Q. When you have a patient who has been
19 diagnosed with lung cancer but subsequently dies of
20 a complication such as pneumonia, what do you list
21 as the cause of death?

22 A. I'll put them both. If I think that the
23 patient was dying of their lung cancer and the --
24 and the final straw on that camel's back was the
25 pneumonia, I list the lung cancer. I don't even --

1 probably don't even list the pneumonia. Or if I do,
2 it's an affiliated condition.

3 On the other hand, if a patient has been
4 doing well with their lung cancer and has been
5 otherwise in remission, suffers pneumonia and dies
6 of the pneumonia, I list the pneumonia; and then, as
7 an affiliated condition, their lung cancer or "due
8 to" or "as a cause of," and I try to balance it in
9 that fashion. Common sense is my usual rule.

10 Q. Other than opinions about when surgery is
11 indicated and when it is not, what are your other
12 opinions as it relates to surgery for a lung cancer
13 patient as it relates to tobacco use?

14 A. I have strong and well-informed opinions
15 about who ought to be doing that surgery, when a
16 patient will tolerate it, what things need to be
17 sampled during that surgery, what things can be
18 appropriately given before or after that surgery
19 and whether they're of any benefit, what the
20 unique problems are caused by giving preoperative
21 treatment, and who that should be given by,
22 et cetera.

23 I mean, other than doing the surgery
24 itself, they're pretty extensive.

25 Q. Are any of these other opinions that you

1 have regarding who should do the surgery, which
2 patients will and won't tolerate it, et cetera --
3 are any of those influenced by whether or not the
4 patient is a smoker or a nonsmoker?

5 A. Yes, all of them are, because they're
6 issues related to their ability to tolerate surgery,
7 which is directly related to their chronic
8 obstructive pulmonary disease or their coronary
9 artery disease.

10 Q. Okay. And, generally, do you have an
11 opinion about how you differ on surgical issues
12 between a smoker and a nonsmoker?

13 A. I think I've -- I've done that, but it's
14 the issue of how much pulmonary dysfunction or
15 cardiac dysfunction they have.

16 Q. Is there any other -- are there any other
17 differences?

18 A. Well, yeah. They also have -- I mean, I
19 focused on the cardiovascular and the pulmonary, but
20 they also have vascular disease, so-called Buerger's
21 disease, blood vessel diseases of the coronary --
22 not -- the cerebral vasculature and what we call
23 peripheral vascular disease, people who've -- who,
24 you know, have blue feet and legs and who require
25 bypass operations. You can -- you can watch them --

1 their vessels constrict as they smoke. I mean,
2 it's -- it's one of the clearly smoking-associated
3 diseases.

4 And if they've got severe peripheral
5 vascular disease or severe cerebral vascular
6 disease, it's just another risk factor for surgery
7 that I have to watch for.

8 Q. Doctor, another area which you have
9 expressed that you believe you have expertise and
10 expert opinions is the field of pathology.

11 A. That's correct.

12 Q. What are your opinions regarding the
13 pathology of a lung cancer patient as it relates to
14 tobacco use?

15 A. I think one of those two pieces, the
16 second --

17 THE WITNESS: What were you calling this?

18 THE COURT REPORTER: Exhibit.

19 THE WITNESS: Hmm?

20 Q. Exhibit.

21 A. Exhibit. The second exhibit, I think,
22 outlines that. It talks about where in the
23 pulmonary tree it arises.

24 I have direct knowledge, both from
25 clinically and from research, about the various

1 nuances of this; have been actively involved in
2 these studies and their translation into clinical
3 trials and how we use them; commented on them
4 extensively in editorials and articles, so in that
5 fashion.

6 Q. Doctor, I'm sure you're familiar with
7 the terms "inter" and "intra-active variability" as
8 it relates to pathology.

9 A. No, I'm not.

10 Q. Okay.

11 A. So why don't you tell me what you mean
12 by them and I'll see if I'm familiar with them.

13 Q. And perhaps I'm using slightly the wrong
14 terminology.

15 Is there an accepted difference between
16 the readings of the same slides between various
17 pathologists?

18 A. Um --

19 Q. And that's what I'm referring to when
20 I said the -- I do believe the "intra-active
21 variability."

22 A. I'm sorry. I think what you mean
23 is intra-observer and inter-observer variability.

24 Q. You are absolutely right. Thank you.

25 A. Okay. Yes. And that's been well-studied

1 in this, as a matter of fact.

2 For many years, we used to rely on
3 pathologists to, if you will, give the blessing for
4 major clinical trials in lung cancer; in particular,
5 sorting out small cell from non-small cell; and
6 earlier on, the various types of non-small cell
7 based upon whether it was adeno or squamous or large
8 cell or bronchioalveolar because we thought there
9 were bigger differences in how they -- how they did,
10 and that that was an important characteristic.

11 And it turned out, over time, that when
12 the cooperative groups began to face constraints on
13 their funding, that they looked at certain diseases
14 and recognized that the inter-observer variability
15 that made a difference for clinical trials was so
16 small on the variations in non-small cell and
17 between small cell and non-small cell, that it was
18 not necessary to have a proactive review of all of
19 these, a prospective review of all these, and so we
20 stopped doing it.

21 The issue is, in point of fact -- as I
22 told you way in the beginning -- is that many of
23 these tumors are mixed. And so, in the past -- and
24 to this day, a pathologist who doesn't do thoracic
25 or pulmonary pathology all the time will look at a

1 cancer. It'll be very, very undifferentiated. And
2 he'll say, "Oh, God, what is this?"

3 And the first area he finds of either
4 glandular differentiation or squamous
5 differentiation, he'll say, "This is a poorly
6 differentiated cancer with some elements of. . ."
7 whatever -- adenocarcinoma, bronchioalveolar,
8 whatever.

9 But what's clearly been demonstrated is:
10 The longer you look, the more you will find, in any
11 individual cancer, all three of those areas. And so
12 if the pathologist, instead of spending two minutes
13 to review, he looks at his heart, and "This is
14 cancer. That's not heart. It came from the lung.
15 It's probably a lung cancer, okay. And it looks
16 like very undifferentiated" --

17 "Oh, there's a little bit of gland
18 formation. This is an adenocarcinoma." Next.
19 He sends a bill for that, and he's off to the next
20 thing.

21 But if you do it on a research basis and
22 you examine the whole slide very, very carefully,
23 what you find is that the inter-observer variability
24 goes up because people say, "Well, you know, I see
25 all the various pieces of it," so it's poorly

1 differentiated with a mixed differentiation, and
2 that's where the big differences are. It's almost
3 never that somebody says, "I think this is
4 squamous," and somebody else says, "It's small cell
5 or adeno." You don't see those kinds of
6 differences, which is why we don't require
7 prospective review of these.

8 On the other -- another example, though,
9 on lymphomas or on leukemias, where the nuances of
10 differences in the histology is so important, before
11 a patient can go on a study, there has to be an
12 agreement or a central review of what that shows
13 before the patient goes on. So it's a very
14 different lung. It's been well-studied. We've
15 carried that through with tens of thousands of
16 patients on national trials, and we just -- we don't
17 do it anymore. It's not necessary.

18 Q. I believe you told me earlier that you do
19 do the immunohistochemical studies or tests at your
20 facility at Moffitt. Correct?

21 A. That's correct.

22 Q. Does the overall pathology results have
23 any determination as to whether or not you proceed
24 with the immunohistochemical testing?

25 A. Well, the pathologist will usually make

1 this distinction himself or herself, based on the
2 tissue that they see. Occasionally, we will say --
3 we have a clinical question that we'd like these
4 things resolved on, and we'll ask them to do certain
5 things.

6 On the other hand, the pathologist will
7 look at a tissue and say, "Well, it could be this.
8 I think this is small cell; therefore, I will do the
9 following tests such as chromogranin -- c-h-r-o-m-o-
10 g-r-a-n-i-n -- or neuron-specific enolase,
11 e-n-o-l-a-s-e -- to sort out and prove that it's
12 small cell. And so we do them in that fashion.

13 Now, what I've studied is having -- when
14 I was at the National Cancer Institute on sabbatical
15 -- as that panel of tests, the immunohistochemical
16 tests, were developed -- and they were mostly
17 developed there, and they became available to us,
18 a whole array of these -- and not just individual
19 tests, but clusters of tests to do these -- there
20 was a thought on their part, and some publications,
21 that suggested this cluster of findings -- these
22 patients did better or they responded to
23 chemotherapy better, et cetera.

24 And so we tested that in two trials
25 that I was chairman of: One, using the Eastern

1 Cooperative Oncology Group data in patients with
2 advanced disease, non-small cell disease; and all of
3 those patients -- their slides were taken down to
4 Bethesda. They were stained. They were read
5 blindly, et cetera.

6 And in the Lung Cancer Study Group
7 slides, all the patients with early disease who had
8 been resected -- in ECOG, we had the small cell as
9 well. And we ran the whole panel of immunohisto-
10 chemical markers on them. It showed they don't help
11 us any more than the basics that we do, and it was
12 very frustrating. We thought we had a lead as to
13 how to do that, but those particular markers were
14 not -- did not add overall to our diagnostic
15 capability, so I'm pretty familiar with that. I
16 spent a lot of time on that damn study and it was
17 negative.

18 Q. And I believe we agreed earlier that,
19 in making a diagnosis of a treatment, an actual
20 tissue sample is preferred and is frequently
21 considered more reliable than a cytology sample.

22 A. In general, yes. I mean, do we make the
23 diagnosis and do we treat patients solely on the
24 basis of cytology? Sure. A good portion of the
25 time. Increasingly so as our ability to stick a

1 very, very fine needle, under CAT scan guidance,
2 into virtually any organ in the body is -- has
3 increased. And the more we do that, the more
4 we rely on cytology.

5 Q. And within the different types of tissues
6 that can be obtained, is there a preference of one
7 over another?

8 A. No. What you're looking for is the one
9 that proves the thing you need to prove. If you
10 have a huge mass in the chest, but it would be
11 surgically removable, you don't need to biopsy that,
12 if they've got something in the adrenal gland that's
13 very tiny, because if the adrenal gland is positive,
14 surgery is not indicated. So you'd biopsy the
15 adrenal instead of the big mass -- it doesn't matter
16 where you get it. It depends on the question you
17 want to answer.

18 We could take up a lot of your remaining
19 time with those nuances, but basically that doesn't
20 matter.

21 Q. Another area which you have expressed
22 expertise, and that you have opinions in that area,
23 is epidemiology. Do you recall that?

24 A. Yes.

25 Q. What opinions do you have, Doctor, within

1 the field or area of epidemiology as it relates to
2 the treatment of cancer patients and tobacco use?

3 A. I talked about the treatment that -- the
4 epidemiology has very little to do with the actual
5 treatment of the diseases. But to the tobacco
6 use, to the causation of the various diseases,
7 epidemiology, in its broadest sense, is how we make
8 those first assumptions, and that's what sends us in
9 the direction of looking for specific biologic
10 facts, whether it's something in the tissue or
11 something in the occupational exposure.

12 It's epidemiology that tells you that all
13 the people that live within "X" miles of a chemical
14 plant have -- or all the people who work in the
15 leather industry have testicular cancer or people
16 who work with benzene have leukemia. It's an
17 epidemiologic study that starts you down that
18 direction, and then you go looking for what the
19 agent is. First, you know they're leather workers
20 or they're chemical workers. Then you find the
21 agent. Then you find, ultimately, that the cell is
22 damaged; ultimately, the gene. I mean, you go down
23 that whole pathway.

24 And, certainly, the thing that started
25 this off in lung cancer was the epidemiologic

1 evidence about the association between smoking and
2 lung cancer.

3 Q. Would you agree, Doctor, that you cannot
4 diagnose or determine the etiology of lung cancer or
5 any disease solely through epidemiology?

6 A. Oh, I don't know if that's true. I think
7 you can get -- I think we're doing needles on --
8 angels on the head of a pin here on peeling these
9 things apart.

10 If you say, "Can you be absolutely
11 100 percent forever after certain from epidemiologic
12 evidence to causation," I don't know. I guess
13 there's a sliver of doubt, whatever, in there.
14 But the -- in some cases, the evidence is absolutely
15 overwhelming and compelling, and it's what led you
16 to the -- to look for the other pieces.

17 Q. The epidemiological studies that you're
18 aware of that relate to a causal connection between
19 cancer and tobacco use, are you aware whether or not
20 those epidemiological studies took into account
21 various confounding factors?

22 A. I don't remember them study by study,
23 but I believe they did, and I think they looked at
24 most of the other things that may be involved in it.
25 And, again, it's not any individual study may or may

1 not have. It's the summation of those studies over
2 20 or 30 years that have led virtually everyone not
3 connected with the tobacco industry to conclude that
4 that data is pretty compelling.

5 Q. Are you aware of any epidemiological
6 results or studies that focused on the Florida
7 Medicaid population?

8 A. I'm not aware of any.

9 Q. Other than the causation opinions that
10 you've already given me today, do you have any other
11 opinions that relate to the field of epidemiology as
12 it relates to cancer and the use of tobacco?

13 A. No. It's just a compelling body of
14 epidemiologic knowledge.

15 Q. Another area that you have expressed
16 expertise in is that of psychology and psychiatry.

17 A. Um-hum.

18 Q. Do you remember that discussion we had
19 earlier?

20 A. Sure do.

21 Q. And I believe at that time you stated
22 that that expertise related to the impact --
23 psychiatric and psychological impact -- that cancer
24 has had regarding patients and those who treated
25 them. Is that correct?

1 A. Yes, but let me make sure I clarify that
2 so that I'm -- as I gain the thrust of this here.
3 That expertise is in the psychological and the
4 psychiatric issues that lead to everything from the
5 choice to smoke or not smoke, the other issues
6 related to behavior modification through issues of
7 the potential impact of psychiatric or psychological
8 variables on outcome, through all the various
9 impacts of the cancer on the patient, on the family,
10 on the staff treating that patient, the interactions
11 between themselves, and then the outcomes of
12 treatment and various decisions on the patient, and
13 all the way through that, how it impacts on them
14 psychologically and psychiatrically, and have
15 actually studied and published extensively in that
16 area; and actually chaired the National American
17 Cancer Society's study section, the review panel
18 that they hand out their grants on behavioral and
19 Psychosocial -- let's see what it's called -- PBR --
20 Psychosocial and Behavioral Research was the
21 committee.

22 And so I saw grants and materials across
23 the entire spectrum of this area, including both
24 traditional psychologic problems that we think of,
25 right through to the full psychiatric diagnoses,

1 their extent or their lack of extent, inpatient, and
2 right up and through issues related to cognitive
3 functioning, the ability to think and function
4 before, after and during treatment, and have
5 published in many of those areas.

6 Q. You listed several areas just now in
7 which the psychological or psychiatric impacts are
8 areas in which you believe you have expertise. Did
9 you just state that one of them was the
10 psychological or psychiatric components of why
11 someone smokes?

12 A. Yes.

13 Q. Okay. What are your opinions in that
14 area?

15 A. Actually, I think I -- in your time
16 constraints -- I'll be happy to go through them
17 again, but that issue -- I'm sorry. My mistake.
18 I was one step ahead of myself.

19 I think that the -- I was going to go
20 into the discussion of why they were stopping and
21 doing the Prochaska data again, and I apologize.
22 I misinterpreted your question.

23 There are theories and concepts people
24 have gone through with why do people pick up a habit
25 and an addiction that they know is destructive, that

1 they know is harmful to their health, and what are
2 the things that they are going through that allows
3 them to continue to do that, and how do
4 they rationalize that; what are the means of
5 understanding that, so we might intervene in
6 that process.

7 It would be nice if we understood
8 that at a psychiatric/psychological level and had a
9 way to intervene in that process. It is very clear
10 that you can threaten the hell out of teenagers with
11 pictures of rotted lungs and lung cancer patients
12 smoking out of their tracheostomies, and all these
13 other terrible consequences, and they just sort of
14 shrug it off.

15 Well, understanding why that happens
16 and why they either begin or continue to smoke is
17 a source of continued interest in this field.

18 Q. And are there any conclusions in that
19 area?

20 A. I don't know that we're -- no, I don't
21 think -- in that particular area, I don't think we
22 have conclusions, other than some of the issues
23 about -- in a very broad, generic sense here -- that
24 adolescents, in particular, feel they're
25 invulnerable, and it's not just smoking behavior.

1 It's driving fast, drinking to excess, using drugs,
2 sexual activity, all these things that they -- they
3 just don't feel there's -- you know, they're going
4 to be here forever. They don't feel mortal.

5 Q. When you have a lung cancer patient
6 who you are treating and who does have a smoking
7 history, do you think they have a different -- or do
8 you have an opinion about whether or not they have a
9 different psychological impact or appreciation for
10 the fact that they perhaps contributed to their
11 disease themselves?

12 A. Yeah. Actually, it's very -- we don't
13 focus on that, because it's -- it's an issue of
14 adding punishment to them in a way -- it's sort of
15 a judgmental issue for them. I speak about their
16 smoking behaviors as it might affect their children,
17 as it may affect others in their family, but I don't
18 usually berate them for having done that. But I
19 would say there's a subset of patients in whom --
20 especially where family members have begged them for
21 years to stop smoking -- there's a fair amount of
22 anger and guilt on their part.

23 Actually, we try to move patients through
24 that as quickly as possible. But if they're
25 thrashing around in guilt, it frequently is

1 associated with thrashing around in other decisions
2 they have to make, and so we try to get them through
3 that period of time and get on to deal with what's
4 in front of them and what they need to do in the
5 future.

6 Q. Is there a different psychological impact
7 on those cancer patients who have acceptance of the
8 fact that they contributed to their disease and who
9 intend to continue smoking?

10 A. Yes, and we know that. There's -- I
11 think I mentioned that before. The studies are very
12 clear that people with lung cancer, whether they've
13 been surgically treated or treated for small cell
14 with chemotherapy -- if they continue to smoke, they
15 do worse. They live shorter and they have more
16 complications of their therapy during that time.
17 Very clear data. So we counsel them on that.

18 Now, if it comes down to a patient saying
19 to me, "I can't -- I'm so addicted. I can't live
20 without it," and he's got three or four months to
21 live, okay, I'm going to look the other way. I
22 don't -- I'm not going to beat him over the head
23 about it.

24 But if this patient has been cured of one
25 lung cancer -- particularly if it was locally

1 advanced or small cell, something where I think
2 they've dodged a bullet -- and they continue to
3 smoke, then I'll get on their case about it pretty
4 severely, and I will really, you know, tell them
5 that they're -- they're playing with fire again;
6 that they dodged one bullet. That doesn't mean
7 they're going to dodge the second one, and that they
8 -- they should stop; and then offer them, you know,
9 whatever resources we have available to them in
10 terms of smoking cessation.

11 Q. Is there a higher percentage of
12 acceptance -- and, again, "acceptance" -- I mean
13 acceptance in terms of the patient accepting the
14 fact that they've contributed to their own disease
15 -- with --

16 MR. SCHLESINGER: You know, I must object
17 to that "contributed to their own disease."
18 That's an amorphous kind of a question, in that
19 it doesn't delineate what you mean by
20 "contributed to their own disease." The
21 causation factor is clear, is smoking.

22 MS. ECKELS: Well, I understand it's
23 clear to you.

24 BY MS. ECKELS:

25 Q. Let me rephrase the question, Doctor.

1 Do you have a percentage of patients who
2 acknowledge that they were aware, and have been
3 aware for a substantial period of time, of the risks
4 of smoking, yet continue to do so?

5 A. Yes.

6 Q. Does that percentage of patients -- or is
7 there a group within that percentage of patients who
8 accept the fact, then, that perhaps they had a
9 contributory role in the creation of this disease?

10 A. I would say 95 percent or better
11 understand that they did it to themselves, and they
12 have varying levels of guilt. Many of them are
13 frustrated that they couldn't stop. Many of them
14 are angry about that. Others are -- you know, it's
15 the whole range of human emotions in here. Others
16 are, "All right. You know, I did it. What can I do
17 about it? Let's get on with life," and they make
18 the best they can. Others berate themselves to the
19 end.

20 Q. Are there a percentage of those patients
21 -- and you just said there's 95 percent or better
22 that had this acknowledge -- make this acknowledge-
23 ment -- that tell you they're not going to quit
24 smoking simply because they don't want to? Not
25 that they can't, but that they don't want to?

1 A. Yes. It's been years since anyone --
2 maybe once a year -- where someone says, "I really
3 don't believe that the cigarettes cause lung
4 cancer." I mean, I almost never hear that anymore.
5 20 years ago, that was not uncommon. And, you know,
6 the refrain then was, "Well, my Uncle Louie, who is
7 80, smoked all his life and he didn't get cancer;
8 therefore, it doesn't cause cancer." But now people
9 -- nobody says that anymore.

10 What they will say -- and, again, I think
11 I just explained -- they will say, "I can't" or "I
12 don't want to stop smoking. I either enjoy it or I
13 can't stop because it's too stress-provoking for
14 me." The "I can't go through the withdrawal"
15 elements of it. "I find it too uncomfortable." And
16 then I make a judgment about how strong I'm going to
17 be about that. And if I think we've either cured or
18 have a shot at curing them, I'm going to pound on
19 them a little bit and offer them whatever resources
20 I can. If we're talking something that's a few
21 months of life left, you know, I'm going to leave
22 him alone.

23 MR. SCHLESINGER: Just note my
24 objection as to the relevancy as far as this
25 particular lawsuit is concerned regarding this

1 consideration of what the patient's feeling
2 is regarding whether or not he knew the
3 consequences of smoking. As far as this
4 lawsuit is concerned, it has no relevancy
5 and no bearing on the issues in this lawsuit.

6 BY MS. ECKELS:

7 Q. Have you done any -- or are you aware
8 of any statistics that break down your patients --
9 between those that are Medicaid patients and those
10 that are not among those who are refusing to stop?

11 A. I'm not aware of any such statistics --

12 Q. Do you -- are you aware of any --

13 A. -- nor do I -- I'm sorry.

14 Q. Go ahead. I didn't --

15 A. Nor am I aware that there is a
16 difference. I mean, I don't suspect that there's a
17 difference based on my clinical experience, and I'm
18 not aware of any data that anybody has collected to
19 look at that particular question.

20 Q. Are you aware of any data that indicates
21 what percentage of the Florida Medicaid population
22 is currently -- are currently smokers?

23 A. I've seen that, and it's the same or
24 a little bit higher than the population at large.
25 But, in general, it mirrors the population at large.

1 Q. Do you --

2 A. It mirrors the population at large based
3 on socioeconomic status. There tends to be heavier
4 smoking among lower socioeconomic groups, lower
5 educational groups. And so if you correct for that
6 issue, then there's no particular difference that I
7 know of between them.

8 Q. But wouldn't you agree with me, Doctor,
9 that the Florida Medicaid population is not going to
10 mirror the spectrum of all economic brackets like
11 the normal population does?

12 A. Of course, by definition. But the point
13 I was trying to make -- and I may have been -- I may
14 have lacked clarity in my answer -- was that, if you
15 look at the whole population, as a large, there's
16 probably a modest -- modestly higher proportion of
17 people in the Medicaid population who smoke.

18 If you go across a group of people who
19 have limited income, and who even qualify for
20 Medicaid but who choose not to take it, or whatever,
21 I suspect that -- or educational level, as an even
22 more important marker, you will find really no
23 difference between Medicaid and non-Medicaid, and I
24 think that that's where the -- that's the point I
25 was trying to make.

1 Q. Is it also your opinion that the Florida
2 Medicaid population mirrors the general population
3 regarding the percentage of those who have stopped
4 smoking and remained tobacco-free?

5 A. Well, since it's the converse of -- or
6 the inverse of what I just said, yes, I think it's
7 -- with the same provisos.

8 Q. Do you know if there is any data that
9 breaks down whether the Medicaid costs affiliated
10 with a former smoker is still being attributed to
11 the fact that they have a smoking history?

12 A. I've not seen the actual data, but I
13 understand there are good algorithms and equations
14 for doing that. I think if someone has smoked for
15 30 years and has stopped for two weeks, that one
16 still has a way to attribute their lung cancer,
17 cardiac disease, pulmonary disease to their smoking
18 history. So I think that is factored into those.
19 I just haven't seen the exact equation and what the
20 data is.

21 Q. And what, in your opinion, would be
22 the period of cessation which needs to exist before
23 you would start to decrease the correlation between
24 their health care costs and the fact that they had
25 a smoking history?

1 A. Yeah. I think that the -- now,
2 you're talking about health care costs in general
3 or cancer-related costs?

4 Q. Well, let's do both.

5 A. Yeah.

6 Q. Start off with cancer-related costs.

7 A. To come up with cancer-related costs.
8 It's really anywhere between 10 and 15 years --
9 closer to 15 -- before you can say their risk has
10 returned to the risk of a nonsmoker, per se.

11 For other health care costs, I think
12 the return on investment is much faster in that
13 area, and that, for peripheral vascular disease,
14 strokes, chronic obstructive pulmonary disease and
15 its exacerbations, and coronary artery disease, that
16 all of those you see relatively prompt improvements
17 in various health measures. And so I would expect
18 that within two or three years of smoking cessation,
19 you would begin to see a reduction in health care
20 costs that was measurable and statistically sound.

21 Q. Have you seen a breakdown of what the
22 various diseases or health care costs are that
23 the State of Florida is correlating to tobacco
24 use within its Medicaid population?

25 A. I've seen reports of it, but I've not

1 seen the actual list itself.

2 Q. Okay. You just stated that, in your
3 opinion, a cessation period of 10 to 15 years
4 returns a former smoker to the risk level of a
5 nonsmoker. Correct?

6 A. That's correct.

7 Q. During that 10- to 15-year period, is
8 there a lock-step decrease in their risk as they
9 finally get to that 10- to 15-year point?

10 A. Yes. It's not lock-step, but it's a
11 smooth downward trend.

12 Q. It decreases proportionately?

13 A. Yes.

14 Q. Do you have any other opinions, Doctor,
15 about the psychiatric or psychological status as it
16 relates to the Florida Medicaid population and those
17 who have been diagnosed with cancer?

18 A. No, I don't.

19 Q. What about those who have been -- same
20 question, but those who have been diagnosed with any
21 other disease.

22 A. No.

23 Q. You also mentioned earlier that you
24 believe you have expertise and also have expert
25 opinions in the field of addiction. Do you remember

1 that, Doctor?

2 A. That's correct.

3 Q. For purposes of our discussion, will you
4 define addiction?

5 A. My working knowledge of addiction
6 is behavior that seeks to replicate some physical
7 or mental or psychological response by either --
8 by some form of ingestion: Breathing, smoking,
9 injecting, swallowing, whatever that is; taking
10 a material that you know is -- that you develop
11 certain biologic and physiologic and psychological
12 compulsions for, and that trying to stop doing
13 that creates physiologic and psychological problems
14 straight through full-scale withdrawal; and that
15 you continue to do that -- continue those behaviors
16 despite the fact that you know that this is not
17 a safe or a healthy behavior, which is what
18 distinguishes being "addicted" to watching
19 basketball games from smoking or drinking or heroin
20 abuse or any other much more potentially lethal and
21 harmful addiction. And I put the "addiction" to
22 watching basketball games in quotations when I say
23 that.

24 Q. What, then, in your terms -- and I'm
25 going to confine this to medical context -- how do

1 you differentiate between an addiction and a habit?

2 A. I don't. And, again, I'm not -- I
3 can't quote a specific paper, but I think the whole
4 discussion in this area has centered around the
5 issues of, you know, when does a habit kick over
6 into an addiction? Most people have felt that it's
7 probably not a clear boundary, and it's also not
8 an issue of major importance; that the -- that you
9 recognize addiction when you see it, which is all
10 those characteristics that I gave before.

11 At some place, a -- some point in time,
12 a habit, if you can actually distinguish that from
13 an addiction -- I'm sorry. If I take something -- a
14 behavior that ultimately is or can be addictive, and
15 for me is addictive, it may have started as a habit,
16 something that I did but had control over; and at
17 some point in time it's something I have less
18 control over, and have physiologic responses when
19 I try to stop it. That's how I would describe the
20 difference. I'm not sure that that's a -- I mean,
21 that's how I would describe it.

22 Q. What are the physiologic responses, that
23 you're aware of, when an individual attempts to stop
24 smoking?

25 A. They get very crabby. They get

1 very anxious. They get diaphoretic, tachycardic.
2 They have intense cravings to -- to have a
3 cigarette.

4 Q. How does that physiologic response to an
5 attempt to stop smoking compare to the physiological
6 response when someone tries to stop using drugs such
7 as heroin or cocaine?

8 A. Actually, it's rather similar. In fact,
9 it's quite a bit more insidious in that -- in that
10 it lasts longer. There's more -- it takes a longer
11 time to get nicotine out of the system than it
12 does -- heroin is out of your system within about
13 24 hours; cocaine, within a -- within a brief period
14 as well.

15 The issues in addiction to that have
16 to do with the need to repeat the pleasurable
17 experience or deal with the other problems. But
18 if you get someone into detoxification for a few
19 days, you can generally -- and then in a treatment
20 program, you can generally move forward quite well
21 with them off of that compound. You don't have the
22 addiction qualities to that. Whereas, cigarettes
23 and alcohol take a significantly longer period of
24 time; cigarettes in particular. It's very hard to
25 -- you can't detox someone quite as rapidly as you

1 can from those other drugs.

2 And some of the physiologic responses
3 are a little bit different in terms of secretions
4 and effects on the bowel, et cetera, but they're
5 not substantively different.

6 Q. Isn't there a substantial difference in
7 the physical aspects of the withdrawal regarding the
8 organ systems?

9 A. Well, it -- you know, I called it
10 a nonsubstantive difference. Yeah, there is a
11 difference in which organ systems are involved, and
12 you certainly have more GI and more nasal and upper
13 respiratory problems with coming off of heroin or
14 cocaine, but the rest of the anxieties -- sweating,
15 cravings, et cetera -- are relatively similar.

16 Q. Is it your testimony, Doctor, that
17 you think it's harder to quit smoking than it is
18 to break a drug habit?

19 A. Yes. Let me clarify that. In a person
20 who wishes to stop smoking or a person who wishes to
21 stop using drugs, that I think it's easier to stop
22 using drugs, such as heroin or cocaine, than it is
23 to stop smoking.

24 Q. Have you ever had personal involvement
25 in a drug-abuse cessation program? Have you ever

1 been involved in one as a physician?

2 A. I've -- yes.

3 Q. When?

4 A. Early in my career and in time that
5 I spent at the free medical clinic in Baltimore for
6 two or three years and sort of as a volunteer there.
7 I had numerous patients who were involved in
8 withdrawal. And in the course of my practice,
9 I have patients who are -- who, in addition to
10 their cancer, have drug abuse problems that require
11 withdrawal; and, certainly, literally thousands of
12 people with cigarette withdrawal.

13 Q. Within the Florida Medicaid population,
14 do you have an opinion as to which is a more serious
15 financial drain on that system, the treatment for a
16 smoking cessation or treatments for cessation from a
17 drug addiction?

18 A. I think that -- I'm sorry. Did you say
19 the costs for the cessation or the costs of those
20 diseases?

21 Q. My particular question was regarding the
22 cessation. Do you think the Florida Medicaid system
23 is spending as much money reimbursing for cessation
24 -- treatment of cessation from smoking versus those
25 that are paying for treatment who are people in --

1 are in clinics trying to break a drug habit?

2 MR. SCHLESINGER: There's some predicate.

3 If you know.

4 THE WITNESS: Yes. Thank you.

5 A. I don't have the details, but I can --
6 I can tell you that here, as in the rest of society,
7 whether it's Medicaid or any other patient
8 population -- and whoever the insurers are, there
9 have been only moderate attempts to appropriately
10 deal with smoking cessation as a covered benefit;
11 that we spend a lot of money on drug abuse, mainly
12 because we're afraid of these people because they
13 commit violent crimes and thefts on their way to --
14 on their drug-seeking behavior, and people who are
15 addicted to cigarettes don't usually go out and rob
16 7-Elevens, et cetera, on their way to buying more
17 cigarettes. So we're, as a society, more afraid
18 of it. So we spend more money on the cessation
19 programs in there, with marginal success in some
20 of those programs.

21 But, in point of fact, though, if you
22 look at the cost to society of cocaine abuse, heroin
23 abuse, any of those drugs, summed all together, the
24 cost of smoking dwarfed them by several orders of
25 magnitude.

1 Q. When you say that, are you taking into
2 account the role that intravenous drug use plays in
3 the AIDS epidemic?

4 A. I can tell you that in the entire history
5 of the AIDS epidemic in the United States, fewer
6 people have died of AIDS than die in one year of
7 lung cancer. And so I will say with absolute and
8 utter and profound certainty that, whether you add
9 in every single case of AIDS related to drug abuse
10 in this state or any other state, that the costs
11 associated with lung cancer dwarf -- absolutely
12 dwarf those associated with drug addiction and AIDS.

13 Q. Is it your belief that the habit of
14 smoking to society has the same detrimental effect
15 as drug use?

16 A. I think it has a far greater detrimental
17 effect. I think that the detrimental effect of drug
18 abuse is overwhelmingly on the people who use the
19 drugs and those who are unfortunate enough to be
20 near them where they can steal whatever they need to
21 support their habits.

22 But the cost of that -- and that's very
23 dramatic. I mean, I don't really want to down-play
24 that at all. I mean, it's obviously something that
25 we're petrified of. We avoid those areas of cities

1 and towns. We hate it. It's a plague on our
2 society.

3 But if you look at the actual dollar
4 value of that compared to what we have to spend to
5 take care of the lung disease, the heart disease,
6 and the cancer related to cigarette addiction and
7 cigarette smoking, it's minuscule compared to that.

8 Q. You stated a moment ago that it is
9 your opinion that the Texas -- I'm sorry -- Florida
10 Medicaid program spends more on drug cessation than
11 it does on tobacco cessation. Correct?

12 A. That's correct.

13 Q. I'd like to ask a similar question but
14 not limit it to cessation programs. Do you have
15 an opinion whether the Florida Medicaid program
16 spends more on drug-related illnesses versus
17 tobacco-related illnesses?

18 MR. SCHLESINGER: Note my objection to
19 that as far as relevancy is concerned.

20 You can go ahead and answer it, Doctor.

21 A. Yes. I -- in keeping exactly with what
22 I just said, the amount of money spent by the State
23 of Florida for tobacco-related illnesses absolutely
24 dwarfs what it spends on drug-related illnesses.

25 Q. When you make that -- when you state

1 that opinion, are you including the moneys spent by
2 the Florida Medicaid program to treat AIDS when you
3 talk about drug-related illnesses?

4 A. Yes. Remember, I ran the AIDS unit for
5 several years in Albany. I know the cost of that.
6 I know that there's a new wrinkle in that in terms
7 of the protease inhibitors that we have available,
8 but they're very limited in what people are being
9 offered. So those costs really haven't hit -- hit
10 the system fully yet.

11 But even with the previous AIDS drugs,
12 we spend gargantuan more money on tobacco-related --
13 and just orders of magnitude -- hundredsfold more
14 money on tobacco-related diseases than we do on
15 drug-related diseases.

16 Q. Let's talk about individual patients for
17 a moment. We touched on this earlier in a different
18 context.

19 You gave me some figures earlier about
20 the costs of treatment for a lung cancer patient,
21 generally: Radiation, the cost of chemotherapy,
22 et cetera.

23 Are you also familiar with the costs of
24 treating an AIDS patient?

25 A. Yes.

1 MR. SCHLESINGER: Again, objection.
2 We're not -- we're not in this -- this is
3 not an AIDS case. This is a smoking-related-
4 disease matter and the manner in which it
5 impacts the Medicaid system in the State of
6 Florida. I object to it on the basis of
7 relevancy and materiality.

8 You can answer if you can, Doctor.

9 BY MS. ECKELS:

10 Q. Let me finish the question first.

11 In comparing the costs between the
12 two for a typical one-year period, do you have an
13 opinion as to which is more expensive, the treatment
14 for a lung cancer patient or the treatment for an
15 AIDS patient?

16 MR. SCHLESINGER: Same objection. This
17 -- this has absolutely no relevancy to --

18 MS. ECKELS: Your objection is on the
19 record.

20 MR. SCHLESINGER: Counselor, don't
21 interrupt me when I'm speaking.

22 MS. ECKELS: Well, you interrupted me a
23 moment ago, so --

24 MR. SCHLESINGER: This has absolutely no
25 relevancy, no materiality, no bearing on any of

1 the issues in this lawsuit.

2 BY MS. ECKELS:

3 Q. You can answer the question, Doctor.

4 A. The issue is the one I explained to you
5 before about the bone marrow transplantation.

6 For an individual AIDS patient,
7 especially if they should go on protease inhibitors,
8 the cost of that treatment is probably substantially
9 more than it is for an individual lung cancer
10 patient. But a thousand lung cancer patients at
11 \$50,000 are going to cost us a heck of a lot more
12 than 50 or 100 AIDS patients on protease inhibitors
13 for the state and -- that was an example. I don't
14 know that those are the numbers, per se, but -- but
15 I use that as an example, again. So the unit cost
16 may be higher for an individual patient, but the
17 volume of tobacco-related disease, when you put it
18 all together -- again, the numbers are staggering;
19 and, therefore, even if the cost of taking care of
20 an AIDS patient is 10 times what it is taking care
21 of a tobacco-related disease patient, the fact that
22 there are thousands of times more of those patients,
23 in total cost, just dwarfs it.

24 Q. But have you seen any breakdown as to how
25 that -- those two populations, those being treated

1 for lung cancer and those being treated for AIDS,
2 appears within the Florida Medicaid population?

3 A. No. I'm generally familiar with it,
4 but I've not seen the specifics of it.

5 Q. Are you prepared, then, to give
6 any testimony which is truly costing the Florida
7 Medicaid system more money, the money they're
8 reimbursing for the treatment of lung cancer
9 patients or the money they're reimbursing
10 currently for AIDS patients?

11 MR. SCHLESINGER: Same objection. No
12 relevancy. No materiality. No bearing on
13 any of the issues in this lawsuit.

14 BY MS. ECKELS:

15 Q. You can answer the question.

16 A. Given the fact that you have asked me
17 about that, and that that might be a source of
18 questioning in the future, and that I have expertise
19 in what the program covers or doesn't, I'll probably
20 go look for what that data is within the Florida
21 Medicaid system, so I would expect to be able to
22 testify on that in -- with some specificity. I can
23 just give you the general answer that I've already
24 given you.

25 MR. SCHLESINGER: Just for the record,

1 Dr. Ruckdeschel, I don't think any court will
2 call upon you to do that.

3 BY MS. ECKELS:

4 Q. Do you have any knowledge, Doctor,
5 what percentage of the Medicaid population has
6 been diagnosed with both cancer and AIDS?

7 A. I don't know it specifically for the
8 Florida Medicaid population, but we were actually
9 the first group in the country to report the
10 increased incidence of lung cancer in AIDS patients
11 back in the late 1980s when we first saw that
12 beginning to come up. And the proportion of AIDS
13 patients who go on to develop malignancies and die
14 of that malignancy as opposed to die of their AIDS
15 is well under 50 percent. I don't remember the
16 number offhand. I'm going to think 20, 25 percent,
17 but even that's a high estimation of that.

18 I have not looked to see what it is this
19 year in the Florida population. But having run an
20 AIDS unit, having defined the -- written the first
21 paper to describe that correlation and published
22 several other papers on increased risk of breast
23 cancer, or whatever, in AIDS patients, that's my
24 remembrance of it.

25 Q. And is it your testimony that there's

1 a high correlation between the two?

2 A. No, it's -- actually, there's a moderate
3 correlation with the development of disorders of the
4 lymph system, which is, of course, the structural
5 manifestation of your immune system, that happens
6 in your lymphatic system. That's the system that is
7 disordered in AIDS. It's been attacked by the virus
8 in AIDS, and therefore we see a fair number of
9 lymphomas.

10 What we noticed, however, was that
11 we began seeing lung and breast and other cancers
12 in a higher incidence than we expected, but that's
13 because we had a population of 30-year-olds.

14 And instead of seeing one lung cancer
15 out of that population of five or six hundred that
16 we might have even vaguely expected, we saw eight
17 or nine.

18 At the same year, we saw 200 or 300
19 regular lung cancer patients and several -- several
20 hundred more COPDs and heart disease. I mean,
21 that's the order of magnitude differences we're
22 talking about here.

23 Q. But within the Florida Medicaid
24 population, should an HIV positive patient also be
25 diagnosed with another disease -- lung cancer, heart

1 disease, whatever -- do you know how they are going
2 to be statistically categorized for reimbursement
3 purposes? In other words, are their medical costs
4 going to be listed as reimbursements for AIDS
5 treatment or reimbursement for cancer treatment?

6 A. There's so few of them, I'm not sure
7 anybody has solved that problem yet. I'm sure
8 whichever one is active.

9 Q. Doctor, can an individual become
10 addicted to anything?

11 A. No. They're usually -- it requires a
12 physiologic response. And by that, I mean either
13 something pleasurable or something that is arousing
14 in some way, whether that's heart rate or mental
15 excitement -- whatever that is -- or reduction in
16 anxiety, some physiologic -- and I'll put it in
17 quotation marks -- "benefit" that the subject
18 entails. So it would be, for example, almost
19 impossible to become addicted to water because
20 it has no biologic activity.

21 You can abuse water. I mean, there are
22 psychiatric disorders where people drink too much
23 water, but you're not physically addicted to that.

24 Nicotine, on the other hand, is an
25 extremely addictive drug -- and there are others,

1 of course -- but it is extremely addictive in the
2 traditional, causing a physiologic response that is
3 defined by the individual as pleasurable.

4 Q. Is there, in your opinion, an addictive
5 personality, meaning a composite personality for
6 an individual who is more likely to become addicted
7 than another person?

8 A. Yeah. I think we have a -- a beginning
9 understanding of this, and I think the -- the
10 pop psychology term for that is "an addictive
11 personality."

12 I think we understand now, for alcoholism
13 and probably for heroin and cocaine addiction as
14 well, that there may be some differences in specific
15 receptors within the brain, as to how people handle
16 these, that there are, in fact, genetic differences
17 that account for some or all of the capacity to
18 become addicted. But we certainly don't understand
19 all of them; and, therefore, we sort of turn that
20 around to say -- because we can't measure all of
21 those, we call it an addictive personality, someone
22 who has trouble with heroin, who is likely to
23 have trouble with drinking or to have trouble with
24 cigarette smoking as well. They lump all of those
25 together. But I don't think that we understand the

1 full array of genetic deficits; nor do we fully
2 understand the issues related to availability.

3 For example, if I was -- if I had a
4 so-called addictive personality, I would have to
5 go out of my way to find a place to get cocaine or
6 heroin, by and large. I mean, I would have to learn
7 a different social circle.

8 On the other hand, if I had an addictive
9 personality and wanted access to cigarettes, I would
10 probably walk 50 feet in any direction and find
11 someone or some facility that would either give me
12 or sell me a cigarette. So there is the issue of
13 availability and, you know, social acceptability.
14 I mean, if I was found smoking a cigarette, I would
15 probably be humiliated to the extent, as the Cancer
16 Center Director, but I don't think anybody would
17 fire me. Whereas, if they found me using cocaine
18 or heroin, I'd be out the door pretty quickly.

19 And so the fear and the compulsion not
20 to ever try that, whether or not I had an addictive
21 personality, is pretty significant; whereas, it's
22 not so for cigarette smoking.

23 Q. And that difference between the two
24 that you just contrasted, smoking versus heroin use,
25 also, tends to follow the lines of use of illegal

1 versus legal products. Correct?

2 MR. SCHLESINGER: Objection; leading.
3 Form.

4 BY MS. ECKELS:

5 Q. You can answer.

6 A. Yeah. I'm -- tell me more what you mean
7 by that. I'm not -- I'm not -- I don't --

8 Q. Well, wouldn't you agree with me that
9 there is a far more social stigma attached with
10 using illegal products, for which you can be
11 criminally prosecuted, than that attached with
12 those that are perfectly legal products?

13 A. Yes. I believe there's more social
14 stigma attached to those.

15 Q. Do you have an opinion, Doctor, as
16 to what factors determine or lead an individual to
17 becoming addicted, in your opinion, to tobacco use?

18 A. Yes. I think that it is a straight-
19 forward nicotine addiction. It's been well-studied,
20 that that's a highly-addictive compound; that that
21 is the addicting substance within it. I think
22 we often confuse the fact that there are frequent
23 social accompaniments of cigarette smoking that
24 are linked to the physiologic benefits of it;
25 that the arousal that comes from smoking, the

1 sense of heightened awareness that comes with that
2 is physiologic from the nicotine. But the fact
3 that we have a cigarette -- or that people have a
4 cigarette after a -- after dinner or after a drink
5 or after sex are positive correlations that people
6 put together with that on a regular basis, and
7 they're -- so they have a little psychological
8 dependence, which is very different from the
9 physiologic dependence on nicotine, which is
10 a -- which is the true addiction.

11 Q. Do you know, or are you aware of the
12 statistics on the number of people who quit smoking
13 annually using the method I'll call "cold turkey,"
14 meaning without going through any particular
15 cessation program?

16 A. Yeah, I've seen that. I don't remember
17 the numbers offhand. There's a substantial portion
18 -- in fact, the majority of people who quit, quit
19 cold turkey. They just make a decision to stop,
20 and they have sort of minimal supports in terms of
21 family members or others that have been through it,
22 or semi formal means of doing that; and that it's
23 actually a fairly -- a much smaller percentage that
24 use nicotine patches, et cetera.

25 I do know, from personal observation,

1 of literally dozens of friends and several hundred
2 patients over the years, that the side effects of
3 going cold turkey are substantial and prolonged for
4 the individuals that haven't -- that is -- it is --
5 I have never heard a person who's a regular smoker
6 say it was easy to quit; never once.

7 Q. Do you know -- or do you not find there
8 to be some conflict between considering smoking to
9 be addictive when you consider the number of people
10 each year who do go cold turkey without any help or
11 assistance?

12 A. No. I think there's no -- there's
13 absolutely no conflict at all. I mean, it's an
14 addiction. People can stop virtually any addiction
15 if they have a compelling reason to do so; and, you
16 know, "compelling" is in the mind of the beholder.
17 And so, whatever compels someone to stop smoking or
18 stop cocaine use or stop heroin usage, it's doable.
19 People are able to do those cold turkey. It has
20 no bearing on whether something is addictive or
21 nonaddictive.

22 Q. Do you think there is an equal success
23 rate among those who try to go cold turkey from drug
24 use as there is with those who attempt to go cold
25 turkey from cigarette smoking?

1 A. I don't remember the numbers. My guess
2 is it would be lower for -- for people on drug use
3 because of all the other social things that go along
4 with that and the strata of life that they generally
5 tend to be in, either at upper or lower end. I
6 mean, the folks who are high-level professionals,
7 who are in a world of significant cocaine abuse,
8 have a hard time coming out of that if they don't
9 come out of that world. And the same with the
10 people at the other end, the street addict who's
11 addicted at that end, and it's a very -- it's a
12 difficult world to change altogether. Changing your
13 smoking environment -- if you've got other family
14 members who have stopped smoking or who don't smoke,
15 you can get to a smoke-free environment.
16 It's harder to do with hard drugs.

17 Q. In your opinion, can people become
18 addicted to sugar?

19 A. No.

20 Q. Can you identify for me, Doctor, any
21 other common consumable products for which you think
22 individuals can become addicted?

23 A. Not off the top of my head, no.

24 Q. Are there degrees of addiction?

25 A. Well, I think I've answered that already,

1 and what people tend to call habituation or habits
2 as it -- as it swings over into addiction, and when
3 does the physiologic response -- which cigarette was
4 it that gave you the physiologic response that
5 you found pleasurable that you were unable to stop
6 versus the one right before that? I'm not sure we
7 have a way to distinguish that. So, yes, I suspect,
8 it to the way you've -- the way you've worded that;
9 there are degrees of addiction, but I don't think
10 that means that -- I don't think that means anything
11 in terms of this particular case. I mean, you start
12 with cigarettes. As you're on your way to full
13 addiction -- you may be on your way to addiction
14 without being fully addicted. You may be easier to
15 stop; there's less usage. And part of that is how
16 much you've used, how much of it has been stored
17 in your body fat, how much of it is stored in other
18 tissues in your body; and, therefore, how much more
19 comes out. So if you've had very little and very
20 occasional usage, you might be -- you might have a
21 reaction where you -- your hands shake a little
22 bit for a day. But if you've been smoking for a
23 prolonged period of time, that goes on for a long
24 period of time.

25 Q. Do you agree that the setting in which

1 one is raised -- in other words, growing up in a
2 household where smoking takes place -- is a factor
3 in whether or not that individual becomes a smoker?

4 A. Well, it's a factor. Whether it's
5 causative or not is not -- not at all clear.

6 We know that -- we see every single
7 variation of that, as we do for other addictive
8 behaviors, like alcohol or drug use. We see
9 children of -- addicts of all sorts either become
10 addicts themselves or become abstainers along the
11 way. We see the whole array of responses to that.

12 So I think that that -- that is highly
13 variable and that there's so much that goes into
14 that, that I'm not sure it's -- I am not sure it's
15 relevant; but, I mean, I'll be glad to pursue it if
16 you want to.

17 Q. I believe you answered this earlier, but
18 I honestly don't recall. Is it your understanding
19 that various types of cessation treatment for a
20 smoker is a reimbursable item under the Florida
21 Medicaid program?

22 A. It's my belief. I don't know that --
23 I don't know that for a fact. The belief is based
24 on the fact that I have, as I routinely do, had
25 patients in our smoking cessation programs. Whether

1 we actually got reimbursed for that or not, I don't
2 remember -- I don't know offhand. But, I mean,
3 nobody has said, "You can't send a patient on
4 Medicaid to a smoking cessation program," so
5 therefore I would continue to do it.

6 Q. Does Moffitt actually have a smoking
7 cessation program?

8 A. Oh, yes; very active.

9 Q. And how long has it existed?

10 A. Really, pretty much since the place
11 opened.

12 Q. And does it have -- are you familiar with
13 its statistics on success rate?

14 A. Not offhand.

15 Q. Do you have an opinion as to whether
16 it's a good or bad success rate?

17 A. It's a good success rate. Remember,
18 again, people who are at a -- it depends on who
19 we're seeing. We see some patients who come there
20 who are hard-core smokers, who are family members,
21 who are having a terrible time with it, and have
22 had multiple attempts, and we're really going into
23 a whole array of psychological and hypnotic and
24 pharmaceutical methods to try to get them to stop.

25 We have other people who are scared

1 witless by what's happened to a family member who
2 are very easy to stop. So it's a little bit of a
3 skewed population compared to the world at large.
4 We have, however, committed, obviously, to a large
5 effort in smoking cessation research.

6 Q. You mentioned earlier that another
7 area in which you feel you have expertise, and have
8 expert opinions, related to consumer behavior in
9 marketing. Do you recall that?

10 A. Yes.

11 Q. What are your opinions, Doctor, as it
12 relates to this matter, in the area of consumer
13 behavior in marketing?

14 I'm sorry. Let me stop you for just
15 one --

16 A. That was fairly broad. I have a --

17 MS. ECKELS: Can we go off the record for
18 just a minute?

19 THE VIDEOGRAPHER: We're off the record
20 at 5:20.

21 (There was a recess from 5:20 p.m. until
22 5:29 p.m.)

23 THE VIDEOGRAPHER: It's 5:29. We're back
24 on the record.

25 BY MS. ECKELS:

1 Q. Doctor, do you have specific opinions
2 in this matter as it relates to the consumer
3 behavior and marketing issues?

4 A. Yes.

5 Q. And what would those opinions be, sir?

6 A. My opinions are that the leading cause
7 of adolescent smoking, that affects them both
8 individually and as a peer group, has been the
9 marketing done by the tobacco industry; that they,
10 in point of fact, market specifically to adolescents
11 because there's a clear recognition that hooking
12 a smoker as an adolescent gives them a lifetime of
13 potential customers; that they have, in fact -- and,
14 as the recent release of the Liggett Myers papers
15 will presumably demonstrate, if the reports are
16 accurate -- that they have known for a long time
17 that they are doing that, and doing it purposefully.

18 I've watched that switch, the arrival of
19 Joe Camel and the other approaches to an adolescent
20 marketplace, and I think it's had an absolutely
21 major detrimental impact on the disease and the
22 problem we were controlling; and that the two areas
23 where we've seen continued problems were the switch
24 to women smoking, with all of the Virginia Slims and
25 the others marketed towards women and now towards

1 adolescents. And so both women and now adolescents
2 -- in particular, adolescent women -- have picked up
3 smoking in increasing numbers, where that had been
4 a downward trend for many years. I think that
5 is absolutely directly related to marketing. And,
6 consequently, if I was a marketing specialist, I
7 would say it was very successful marketing from the
8 perspective of sales.

9 Q. Have you ever published anything, Doctor,
10 in the area of consumer behavior or marketing as it
11 relates to tobacco products?

12 A. No.

13 Q. Have you ever taught any courses
14 or seminars as it -- on the subject of consumer
15 behavior in marketing in consumable products?

16 A. No.

17 Q. Have you ever drafted or authored a
18 marketing plan yourself?

19 A. Yes.

20 Q. When?

21 A. The past several years, directed a
22 marketing program to allow patients and families in
23 this area to understand the perverse influence of
24 the HMO industry and its manipulation of cost data
25 and its failure to allow access to academic health

1 centers. I directed, designed, studied, understood,
2 reported on, and very successfully ran a marketing
3 campaign which outlined that and told people how --
4 where to call and what to do and understand most of
5 the principles of consumer marketing; patients, of
6 course, being -- potential patients, of course,
7 being our consumers.

8 Q. Would that be a marketing plan geared
9 more toward education as opposed to sales?

10 A. No. It's, quote/unquote, "sales," if you
11 will. It's patients coming to the center. That's
12 our source of revenue.

13 Q. And did you hire or retain any type
14 of consultant or marketing or advertising firm
15 whatsoever that assisted you in that effort?

16 A. Yes, we did.

17 Q. And who did you retain?

18 A. FKQ Advertising here in Tampa.

19 Q. And why did you feel it was necessary
20 to retain an advertising agency in that vein?

21 A. Because there are elements of specificity
22 of the process in terms of which flights on TV and
23 radio and when to use those that are not areas of
24 my expertise. My areas -- I've learned them through
25 that process. But those are still technical things

1 that, you know, even though I know how to repair
2 my car, I would -- I would take it to a car
3 repairman. So even though I could design the
4 flights of when we would do TV and newspaper ads,
5 based on when we have peak seasons and when the --
6 down here, and when we have the changeover periods
7 and the re-signing periods for HMO plans -- they
8 come at certain fixed dates in this state. Even
9 though I could design when those flights should
10 be, I'd still have someone else do that. I mean,
11 I just -- it's not my necessity to do that.

12 But, certainly, the concept of our focus
13 on research and how we presented that argument was
14 something that I designed and managed the full way.

15 Q. Do you think that -- or is it your
16 opinion that your involvement in the marketing plan
17 of Moffitt qualifies you as an expert in the field
18 of marketing as it relates to nationwide products?

19 A. I didn't make that assumption.
20 You've just made that one.

21 What I said -- you asked me if I'd done
22 that -- if I had done a marketing plan, and I said
23 I had. I think the area of expertise comes from
24 watching multiple sources over a 20-year period,
25 listening to literally hundreds of discussions, both

1 nationally and internationally, about the impact
2 of marketing on smoking behavior, on its impact on
3 adolescents, watching and participating in countless
4 conferences where that was part of the discussion
5 that went on at those conferences.

6 Q. Do you sit on any panels or committees
7 whose goals or objective involve marketing of
8 products?

9 A. I'm not sure what you mean by that.

10 Q. Any professional associations,
11 organizations, whose principal membership involved
12 those involved in the marketing profession or the
13 advertising profession.

14 A. I don't believe so.

15 Q. Have you ever been involved in any
16 type of a marketing effort, other than the one from
17 Moffitt that you previously described?

18 A. Yes.

19 Q. What would that be?

20 A. Several different marketing approaches in
21 Albany to support of academic health centers in that
22 particular environment.

23 Q. Would it be correct to say that all of
24 the marketing efforts you've been involved to have
25 related to medical services at various facilities

1 that you've been affiliated with?

2 A. Yes.

3 Q. You also mentioned earlier that you
4 believed you had expertise and had expert opinions
5 regarding cigarette design and manufacturing.
6 Do you recall that?

7 A. No. I think -- I think I recall
8 differently. I think what I said was that I
9 have no particular expertise in how one designs or
10 manufactures a cigarette; but that, in point of
11 fact, if the -- what I felt I had expertise on
12 is that, once that design had been made, if there
13 was a change in the flow characteristics or in
14 the particle size coming through, that I did have
15 expertise on what the impact was. And there's
16 certainly no question, as I think I've outlined
17 in Exhibit 2, that particle size related to filter
18 porosity is important in how far out particles get
19 within the lungs; and, secondly, that the amount of
20 draw and the amount of nicotine in a cigarette can
21 be moved up and down, and that individuals will
22 balance their -- the depth of their puffs and
23 the number of puffs they take and how far they
24 smoke down to get to the same level of nicotine, no
25 matter what you do to those other elements of it.

1 I'm familiar with those from various sources over
2 the years in smoking cessation research.

3 Q. Do you have an opinion as to whether
4 or not there are varying levels of nicotine in the
5 various brands of cigarettes?

6 A. I have an opinion, yes.

7 Q. And that opinion would be what, sir?

8 A. That there are highly variable
9 levels; and that, in part, the tobacco industry has
10 manipulated that level.

11 Q. And on what do you base that opinion,
12 sir?

13 A. Multiple breast reports.

14 Q. Anything other than the breast?

15 A. No.

16 Q. Have you ever visited a tobacco facility
17 and observed the cigarette being manufactured?

18 A. No.

19 Q. Do you think that relying strictly
20 on the press is a reliable source of information?

21 A. I think it is one source of information
22 that I put together with other sources to draw an
23 opinion.

24 Q. What other sources have you relied on?

25 A. Discussions with other people who are

1 expert in the field. I mean, it's a -- it's a
2 common source of discussion at meetings as the
3 revelations come out about manipulating nicotine
4 levels.

5 Q. Can you name any other experts that
6 you've had these discussions with regarding nicotine
7 levels?

8 A. It's -- I mean, I'd be naming all the
9 people in the area of lung cancer who've -- who
10 discuss this routinely at meetings.

11 Q. Do you have any other opinions as it
12 relates to -- other than varying nicotine levels and
13 how that may affect one's desire or smoking pattern,
14 do you have any other opinions that relate to
15 cigarette design and manufacturing?

16 A. No.

17 Q. Have you ever published anything in
18 the field or on the subject of cigarette design and
19 manufacturing?

20 A. No.

21 Q. Have you ever given any speeches
22 or seminars or presentations on the subject
23 of cigarette design and manufacturing?

24 A. Not on their design and manufacturing but
25 on the impact of that in terms of the particle sizes

1 it comes through, as I've already discussed.

2 Q. Would you feel qualified to give any
3 type of presentation or to publish on the subjects
4 of actual cigarette design and/or manufacturing?

5 A. No. Of course not.

6 Q. Is there a -- you've mentioned a couple
7 of times "particle size" and "draw."

8 A. Um-hum.

9 Q. Is there a range, if you will, or can you
10 define that further for me?

11 A. I can't put the actual measurements
12 on it, but if you -- if you take -- and I've seen
13 the filters from those machines. If you take an
14 unfiltered cigarette, there are visible particles.
15 If you take a filtered cigarette, it's more of a
16 stain on that, and I -- that's what I'm talking
17 about in particle size.

18 Q. Doctor, let me hand you what we'll mark
19 as Exhibit 3.

20 MS. ECKELS: Here's a courtesy copy for
21 you.

22 MR. SCHLESINGER: Hand it to me first.
23 Thank you.

24 (The document was marked as Ruckdeschel
25 Exhibit Number 3 for identification.)

1 BY MS. ECKELS:

2 Q. That is an "Expert Disclosure" and --
3 I brought an extra one for the court reporter if
4 you need it -- that's been produced in this case.

5 Have you ever seen this before, Doctor?

6 A. No.

7 Q. I take it, then, since you have not
8 seen this before, that you did not author this?

9 A. I gave this information to the attorneys
10 in the course of my discussion with them.

11 Q. Okay. Could you read for me the last
12 sentence of that full paragraph, under "Subject
13 Matter and Substance of Anticipated Testimony"?

14 A. "He is expected to testify concerning
15 the follow issues: diagnosis of lung cancer,
16 treatment of lung cancer and costs of same; overall
17 management of patients with lung cancer and that
18 tobacco causes lung cancer and other cancers."

19 Q. And you have offered me opinions
20 today on those subjects, have you not, sir?

21 A. That is correct.

22 Q. You've also, have you not, offered
23 me opinions on various other subjects, other than
24 these. Correct?

25 A. That's correct, when I was asked to.

1 Q. You've also offered opinions on
2 addiction, psychiatric and psychological effects,
3 epidemiology, pathology, et cetera. Correct?

4 A. That's correct.

5 Q. None of those areas of expertise are
6 listed here in your Expert Disclosure, are they,
7 Doctor?

8 A. No, but I've -- those are ones that
9 you asked me about, so I responded what I knew..

10 Q. And I appreciate that.

11 MS. ECKELS: At this point, knowing that
12 we've got less than five minutes left on the
13 deposition, let me just make a record that this
14 Expert Disclosure is incomplete and inaccurate;
15 and based on this inaccurate and incomplete
16 disclosure, this deposition was originally
17 scheduled and agreed to a schedule of just a
18 six-hour deposition.

19 It is the position of the defendants that
20 this is an inadequate period of time in which
21 to depose this expert, given its broad range
22 of expertise and opinions that have been
23 mentioned for the first time today during this
24 deposition; and there's a strong possibility
25 that the defendants will seek additional time

1 to continue this deposition so that the full
2 range of opinions, as offered and outlined by
3 this witness today, can be completely explored.

4 Having made that record, I think
5 basically our time is up. The videographer is
6 kind of nodding at me, saying I have about two
7 minutes or less, so at this point, I think -- I
8 really can't get into much more with you today,
9 and I appreciate your time so far, Doctor.

10 MR. SCHLESINGER: Let the record reflect
11 that the plaintiff has no questions.

12 THE COURT REPORTER: Reading and signing?

13 MR. SCHLESINGER: We do not waive.

14 THE VIDEOGRAPHER: The time is 5:42.

15 This is the end of the third tape of the
16 deposition of Dr. Ruckdeschel.

17 THE WITNESS: Very good.

18 MR. SCHLESINGER: I want a copy of the
19 deposition. Do you have an ASCII disk?

20 THE COURT REPORTER: Yes.

21 MR. SCHLESINGER: I'll take that.

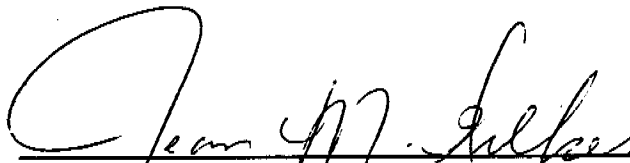

22 (The deposition was adjourned at
23 5:42 p.m.)
24
25

CERTIFICATE OF OATH

STATE OF FLORIDA)
COUNTY OF HILLSBOROUGH)

I, the undersigned authority, certify that JOHN C. RUCKDESCHEL, M.D., personally appeared before me and was duly sworn.

WITNESS my hand and official seal this
1th day of May, 1997.

JEAN M. WILKES, RPR-CP
Notary Public - State of Florida
My Commission No. CC 502194
Expires: 10/21/99

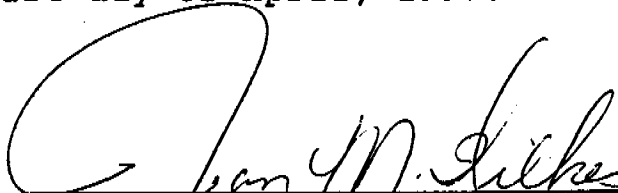

REPORTER'S DEPOSITION CERTIFICATE WITH ACKNOWLEDGMENT

STATE OF FLORIDA)
COUNTY OF HILLSBOROUGH)

I, JEAN M. WILKES, RPR-CP, Certified Shorthand Reporter, certify that I was authorized to and did stenographically report the foregoing deposition; and that the transcript is a true record of the testimony given by the witness.

I FURTHER CERTIFY that I am not a relative, employee, attorney, or counsel of any of the parties, nor am I a relative or employee of the parties' attorneys or counsel connected with the action, nor am I financially interested in the action.

DATED this 1st day of April, 1997.

JEAN M. WILKES, RPR-CP
Notary Public - State of Florida
My Commission No. CC 502194
Expires: 10/21/99
